General non-discriminatory approach

In order to make it easier to read, this document uses the male form in grammatical structures but with an implied neutral sense. It is aimed equally at both men and women. We kindly ask female readers for their understanding in this simplification of the text.

Supplementary information

Read the following supplementary information in its entirety!

# 1 Operating Concept

There are two manuals associated with the DCM510 controller, this Assembly and Operating Instruction manual and a separate Browser manual. The Browser manual covers all Ethernet and WiFi communications and how to program the unit via a PC, tablet or Smartphone. Most programming operations are more easily performed using the embedded browser interface and your favorite internet browser.

## 1.1 The Front Panel

The DCM510 uses an OLED (Organic LED) text display to indicate real time values of up to 6 sensors on the main display, one multicolored Status LED to indicate alarms and unusual conditions and 9 multicolored LEDs to indicate output status.

![The Front Panel](image)

**Figure 1** The Front Panel

**Status LED**

In the event of an alarm, the controller's status LED at the upper right corner of the keypad changes from 'blue' to 'flashing red'. If one of the feeders is set to manual STOP, the status LED will be 'solid red'.

![Status LED](image)

**Figure 2 Status LED**
Navigating the Menu

The communication indication panel is located at the bottom center of the controller face. A green light indicates the function is available. If the port is in use, the green light blinks.

![Communication Status LEDs](image)

### 1.3 Changing the Operating Language

The operating language is currently offered in English only.

### 1.4 Keypad Lock

The controller has an available keypad lock. If the keypad lock is enabled, access requires a passcode. The keypad password is the same as the password used in the Ethernet or Wi-Fi browser connection.

See **11.2.2 Keypad Passwords**
### 2 Navigating the [Menu] display

Table 2 Main Menu lookup

![Figure 4 Typical default screen](image1.png)  ![Figure 4A Screen if any alarm present](image2.png)

The default display exhibits up to six current sensor values, and STATUS, ALARM and SETPNT buttons. The sensor choices can be changed or rearranged. See section 2.2 Modifying the 'Home' Screen. The STATUS button (F1) is explained in section 2.1 Input/Output Status. The Alarm button (F2) allows the user to view and clear the latest alarms for all I/O points. See also section 9.7.3 Analog Alarm Configuration, for more information on alarms.

The SETPNT button (F3) allows the user to edit the set-point of any enabled control relay.
2.1 Input/Output Status [momentary display]

The Home screen, shown here with 6 input signal values, has a momentary display in addition to the three F key choices. The momentary display shows the status of the input in the same manner as the status key except that it is only viewed for as long as you hold down the right arrow.

1- From main display press Down arrow key to invoke a cursor, ➔, then continue with the down arrow to select a desired sensor.

2- Use Right arrow key ➔ to momentarily see sensor information.

3- Use Left arrow key ➔ to momentarily see any output that is tied to the selected input.

4- Use ESC key Esc to Exit.

Note: The momentary information will remain on the display as long as you hold down the arrow key.

Open Loop Warning

If you choose a 4-20mA output and press the right arrow, if the loop is not properly wired, you will see an Open Loop error.
2.2 Modifying the ‘Home’ Screen

To set (modify) the Home Screen press **MENU**

1- Use the Up/Down Arrows to navigate to **System** then press **OK**
2- Scroll to **Display Setup** then press **OK**

You will now have the choice of ‘Scrolling’ the Home display. Once you choose the display points, if you choose ‘scroll’, you will see three points at a time.

3- Choose to scroll the I/O displayed or not by pressing F2 **SWITCH**. Press F1 **Save** if appropriate.
4- Press F3 **NEXT** to continue.
5- Press F2 **ADJUST** to fill the display with I/O points or F3 **NEXT** to set the scrolling hold time.
6- Use the up/down arrows to find an I/O point for the top left corner of the display. Press F1 to **SELECT** it then F2 to go to the NEXT choice.
7- Continue choosing I/O points in this manner. At any time, press ESC key to exit.

3 Identcode

The DCM model Identification Code [identcode] is not normally used for DCM controllers, a part number is normally used to identify the configuration of the controller package. If you have an identcode, and would like to know more about it, consult ProMinent customer service or the ProMinent e-quote website: New.ProMinenteQuote.com.
4 Safety and Responsibility

4.1 Explanation of the safety information

Introduction

CAUTION!
Read all installation and operating instructions completely before installing and operating this equipment.

These operating instructions provide information on the technical data and functions of the product, as well as detailed safety information and are provided as guidance for the installer and operator.

The safety information and notes are categorized according to the following scheme. A number of different symbols are used to denote different situations.

The symbols shown here serve only as examples.

DANGER!
Denotes an immediate threatening danger. If this is disregarded, it will result in very serious or fatal injuries.

WARNING!
Denotes a hazardous situation. If this is disregarded, it could result in very serious or fatal injuries.

CAUTION!
Denotes a possibly hazardous situation. If this is disregarded, it could result in slight or minor injuries. May also be used as a warning about equipment damage.

Denotes hints on use and other helpful information

NOTICE
Denotes a possibly damaging situation. If this notice is disregarded the product or an item near it could be damaged.
4.2 General Safety Notes

- **Measure**: Before opening the enclosure or before carrying out installation work, ensure the devices are voltage-free.
- Disconnect damaged, defective or modified devices from the power supply.

**WARNING!**

- Live parts!
- Possible consequence: very serious or fatal injuries

**WARNING!**

- Danger from hazardous substances!
- Possible consequence: Fatal or very serious injuries.
- Please ensure when handling hazardous substances that you have read the latest safety data sheets provided by the manufacture of the hazardous substance. The actions required are described in safety data sheets.
- Check safety data sheets regularly and replace, if necessary, as the hazard potential of a substance can be re-evaluated at any time based on new findings.
- The system operator is responsible for ensuring that up to date safety data sheets are available, as well as for producing an associated hazard assessment for the workstations affected.

**WARNING!**

- Operating faults!
- Possible consequence: Fatal or very serious injuries.
- The unit should only be operated by adequately qualified and technically expert personnel
- Please also observe the operating instructions for sensors and fittings and any other units which may be installed, such as sample water pumps
- The operator is responsible for ensuring that personnel are qualified.

**CAUTION!**

- Symbol will be applied beside each MAINs socket outlet identifying that the maximum total output current rating on all relays should not exceed 5A

**DANGER**

- Hazardous voltages cause severe injury or death. Disconnect all sources of power before servicing.
- (Multiple and/or remote sources of power may be present).

**NOTICE**

- Correct sensor operation
- Damage to the product or its surroundings.
- Correct measuring and metering is only possible if the sensors are working correctly.
- Check, clean and calibrate the sensors regularly
- Investigate all alarm conditions.
4.3 Intended Use

The device is intended for measuring and regulating water chemistry, temperature, flow and other conditions in pools, spas, water features, splash pads and other aquatic water treatment applications.

Only use the device in accordance with the technical data and specifications outlined in these operating instructions and in the operating instructions for the individual components (such as sensors, fittings, calibration devices, metering pumps, etc.).

Any other uses or modifications may void the ProMinent warranty.

CAUTION!

If the equipment supplied is used in a manner not specified in these instructions, protection provided by the equipment may be impaired.

CAUTION!

Aquatic Water Treatment Controllers operate chemical feeders and other devices that may pump hazardous, corrosive and toxic chemicals. Fully understand the implications of the control set-points, interlocks and alarms that you select. Injury and damage to equipment may result from improper application.

CAUTION!

READ AND FOLLOW ALL SDS PRECAUTIONS REGARDING CHEMICALS USED

Water disinfection control involves irritating, corrosive, caustic, and potentially toxic chemicals. Please use extreme caution and comply with all national, state and local regulations and recommendations for the handling and storage of these chemicals.

It is the responsibility of the user of this equipment to obtain and follow the safety precautions of the manufacturer of the hazardous materials, including the proper use of all personal protective equipment.

CAUTION!

The pertinent accident prevention regulations, as well as all other generally acknowledged safety regulations, must be adhered to!
**WARNING!**

ProMinent controllers, like all modern electronic devices can be damaged by severe electrical spikes and surges, like lightning. Every effort has been made to harden your controller against such surges, but no precautions are 100% effective. Additional surge protection can be installed at time of installation, but even that is not a guarantee that surge damage will not occur. If surge damage occurs, chemicals could be fed to your pool or spa, continuously with no safety controls. If you inspect your ProMinent controller after a possibly damaging power surge (thunderstorm or power outage) and suspect the controller is not operating properly, disconnect the chemical feeders at once, and contact your ProMinent dealer for service.

**WARNING!**

**ALWAYS USE ANTI-SYPHON DEVICES**

Uncontrolled feeding of chemicals can result in injury or death. Anti-Syphon devices must be installed on chemical feeders to prevent uncontrolled feed of concentrated chemicals. If a vacuum is created in the water circulation line and no anti-siphon device is installed on the chemical feeders, potentially hazardous concentrations of chemicals can be drawn into pool or spa. Always use injection check valves and anti-siphon valves in the chemical feed lines to prevent this situation.

**WARNING!**

**FLOW INTERLOCKS SHOULD NEVER BE BYPASSED, EVEN TEMPORARILY.**

The DCM510 series has the capability to assign a low flow interlock for a connected flow meter. The previous flowswitch precaution also pertains to those low flow lockouts. If the interlock is disabled or bypassed, the sensor would not be able to sense a hazardous situation and turn off the chemical feed pumps to prevent uncontrolled chemical feed.

**WARNING!**

**NEVER CONNECT FEEDER DIRECTLY TO POWER SOURCE**

If the chemical feeders are connected solely to a wall outlet, the safety devices integral to your ProMinent controller, and necessary for the safe feeding of chemicals, may be bypassed. It is very important that the chemical feeders be connected to the controller and never solely to a wall outlet as the only way to control the feed of chemicals.
**WARNING!**

**TEST FLOW SWITCH INTERLOCK REGULARLY**

Testing of the flow switch regularly is essential to assure the flow switch stops chemical feed, remains stopped, and controller shows “Interlocked” within 20 seconds, whenever circulation flow stops. If the flow switch does not interlock chemical feed, plumbing corrections or the installation of additional flow switches or lockouts will be necessary to avoid uncontrolled chemical feed.

**WARNING!**

**NEVER OVERRIDE A FLOW SWITCH**

Uncontrolled feeding of concentrated chemicals can result in personal injury or death. Sample and recirculation flow switches are critical safety devices which prevent uncontrolled chemical feed. Follow Instructions Carefully.

A Sample flow switch is provided with all ProMinent pool controllers and is an integral safety device to prevent the uncontrolled feed of chemicals, which could cause personal injury or death. This critical safety device must always be available to protect the swimmers and others near the pool.

An additional return line flow switch should always be installed to prevent chemical feed if return water to the pool is restricted.

**WARNING!**

**ELECTRICAL SURGES CAN DAMAGE YOUR CONTROLLER**

Uncontrolled feeding of chemicals can result in injury or death.

A damaged controller could feed chemicals in an uncontrolled manner.

If you suspect your ProMinent controller is not operating properly, disconnect it from the chemical feeders until the problem has been corrected.

**WARNING!**

Chemical feed during periods of no water flow, like filter backwash, can pose a serious health threat from potentially high chemical concentrations and hazardous chlorine gas formation.

This product must be installed with interlocks in place to avoid chemical overdose in case of loss of circulation flow in Pools and Spas.
4.4 Warranty Guide

As of this date, the physical controller is warranted for 5 years from the date of purchase as explained in the complete ProMinent warranty. The complete warranty is found in the ProMinent catalog introduction and is available online at www.prominent.us. Changes to this warranty may not be shown in this manual.

Residual sensors are typically warranted for 12 months and the Industrial pH and ORP sensors are warranted for 24 months. All other sensors are warranted for 8 months.

The warranty does not apply to goods that become defective for the reason of:

a) Unsuitable or unreasonable use
b) Faulty assembly, installation or servicing by the purchaser or any third party
c) Faulty or careless handling

4.5 Users’ Qualifications

**WARNING!**

Danger of injury to inadequately qualified personnel!

The operator of the plant / device is responsible for ensuring that the qualifications are fulfilled. If inadequately qualified personnel work on the unit or loiter in the hazard zone of the unit, this could result in dangers that could cause serious injuries and material damage.

All work on the unit should therefore only be conducted by qualified personnel. Unqualified personnel should be kept away from the hazard zone.

4.5.1 Training

<table>
<thead>
<tr>
<th>Training</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instructed personnel</td>
<td>An instructed person is a person who has been instructed and, if required, trained in the tasks assigned to him/ her and possible dangers that could result from improper behavior, as well as having been instructed in the required protective equipment and protective measures.</td>
</tr>
<tr>
<td>Trained user</td>
<td>A trained user is a person who fulfills the requirements of an instructed person and who has also received additional training specific to the system from ProMinent or another authorized distribution partner.</td>
</tr>
<tr>
<td>Trained qualified personnel</td>
<td>A qualified employee is deemed to be a person who is able to assess the tasks assigned to him and recognize possible hazards based on his/her training, knowledge and experience, as well as knowledge of pertinent regulations. The assessment of a person's technical training can also be based on several years of work in the relevant field.</td>
</tr>
<tr>
<td>Electrician</td>
<td>Electricians are deemed to be people, who are able to complete work on electrical systems and recognize and avoid possible hazards independently based on his/her technical training and experience, as well as knowledge of pertinent standards and regulations. Electricians should be specifically trained for the working environment in which they are employed and know the relevant standards and regulations. Electricians must comply with the provisions of the applicable statutory directives on accident prevention.</td>
</tr>
<tr>
<td>Customer Service department</td>
<td>Customer Service department refers to service technicians, who have received proven training and have been authorized by ProMinent to work on the system.</td>
</tr>
</tbody>
</table>

**Table 4 Training Definitions**
5 Functional Description

The DULCOMETER® DCM510 is a Multi-parameter control and analysis platform from ProMinent. In the remainder of this document, the term ‘controller’ is consistently used for the DULCOMETER® DCM510. The controller has been developed for continuous measurement and control of liquid analysis parameters in Aquatic applications. The controller can operate together with conventional analog and digital sensors and actuators. The controller is also equipped to communicate with some sensors using a proprietary serial bus.

The controller’s powered AC relays 1 and 2 may be used with solenoids, chemical metering pumps and related water treatment equipment, not to exceed 5 Amps total. Relays 3, 4, and 5 are dry contact mechanical relays that can be powered or unpowered “dry” contacts. If they are powered from the internal AC line power bus, they are fused by the same 5 Ampere fuse and limitation. If they are powered externally, external fusing may be required.

Typical applications:
- Swimming Pools
- Spas
- Water Features
- Zero Depth pools
- Splash Pads
- Therapy Pools
- Fountains
- Habitat environments for Mammals and Cetaceans

Standard Features:
- Two serial input channels for use with dual serial corrosion rate sensors or DP (differential Pressure) sensors.
- One dedicated digital Sample Flow switch input “O”.
- Eight multi-purpose digital inputs for turbine and contact water meters and limit switches. (“U” and “V” are NAMUR - Intrinsically safe contact inputs). See foot note on next page.
- One 4-20mA isolated analog input.
- One onboard analog temperature input.
- Temperature used for compensation of pH and conductivity sensor signals.
- Output Relays: On-Off, Time Modulated, (Pulse Width Modulation), Time Cycling, or PID control using any/all of the following: line voltage relays(2), unpowered ‘dry’ contacts(3), or Solid State DC contacts(4).
- Currently, 1 operating language (English)
- Saving the Controller Configuration to internal flash memory
- Cloning of controller configuration by saving and uploading via USB Flash Drive.
- Upgrading of the firmware using USB Flash Drive Data-logging all I/O at a 5-minute rate for 1 month.
- Ethernet LAN connection for remote monitor, operation or configuration.

Optional accessories:
- Up to 3 dual sensor input/output driver cards including:
  - Dual pH/ORP,
  - Single pH/ORP with temperature and 4-20mA input,
  - Conductivity/Temperature,
  - Dual 4-20mA Output,
  - Dual 4-20mA input
  - or a Dual Serial Input driver.

- A full line of ProMinent sensors as well as signals from most 4-20mA devices are compatible with the 4-20mA input. Sensors include: Free and Total Chlorine, Bromine for a number of specific applications including, stabilized, salt and seawater pools

- 1 Expansion card slot
Mounting and Installation

- 1 Modbus-RTU Master port for Fluorimeter sensor input
- 1 Modbus RTU Slave port
- 1 Dual Analog input slot (4-20mA)
- 2 Analog outputs (4-20mA)
- Wi-Fi WLAN local access

Footnote: Namur Input Data

Passive amplifier passive to Namur:
(DIN19234-> EN60947-5-6)
Power supply: 8.2V / 1kOhm (proximity sensor)
High: 2.2mA..6.5mA
Low: 0.4mA..1.1mA
Operating range: 1.2mA..2.1mA (not continuous)
Switching current diff :: 0.2mA (input constant)
H / L threshold: 1.6mA
(Fraction: <0.2mA)

Footnote 2: Complete Expansion Card information is available in the Addendum DCM510 Communication Driver Card manual. Download it from the ProMinent.com web site.

6 Mounting and Installation

User qualification, mechanical installation: trained qualified personnel, see Section 4.5 Users' qualifications.
User qualification, electrical installation: Electrical technician, see Section 4.5 Users' qualifications.

⚠️ CAUTION!

Controller must be installed in a manner that the power plug can be pulled out easily or the power disconnect switch can be reached easily.

Mounting position

- Install the DCM510 OLED screen at eye level to make operation easiest.
- The controller is mounted as a system on an acrylic backpanel with the modular in-line probe housing as standard.
- Always install the controller vertically, so that the cable connections are on the bottom of the enclosure.
- If removing the controller from the supplied acrylic panel, leave sufficient free space (~18") for cables and access to any sensors or sample plumbing.
6.1 Scope of Supply

The following components are included as standard:

<table>
<thead>
<tr>
<th>Description</th>
<th>Quantity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Controller DCM51x (AGIb) factory mounted on 18x30&quot; polypro wall bracket</td>

</table>

Membrane oxidant residual sensors are pre-wired and pre-installed in the modular sensor housing, however they have **not** been charged with the required electrolyte. Please follow the instructions in the accompanying sensor manuals for electrolyte charging of the sensors.

pH and ORP sensors have pre-installed and labeled coaxial cables with SN6 connectors for easy connection to the sensors, but the sensors are not installed in the modular sensor housing.

**NOTICE**

Mounting position and conditions

The controller is rated for IP 65 liquid protection, and is equivalent to NEMA 4X (indoor) for air tightness. These standards are only achieved if all seals and threaded connectors are correctly rated and installed.

Electrical installation should only be performed after mechanical installation.

Ensure that there is unimpeded access for operation, but in a room that prevents public access.

The installation must be secure, low-vibration

Avoid direct sunlight

Permissible ambient temperature of the controller’s electrical enclosure at the installation location: -20 to 60°C (-4 to 140°F) at max. 95% relative air humidity (non-condensing)

Take into consideration the permissible ambient temperature of the connected sensors and other components.

The controller is only suitable for operation in closed rooms. If operated outside, the controller must be protected against the environment by a suitable protective enclosure.

All above conditions apply at or below an altitude of 2,000 meters. (6,500 feet)
6.2 Mechanical installation

6.2.1 Wall mounting (of polypro backplane)

Mounting materials provided by others

(4) 3/8" Wall mounting holes are as shown in the drawing below

Remote mounting (optional)

Mounting materials (contained in the scope of supply)

- 1 x wall bracket
- 4 x PT screws 5 x 35 mm
- 4 x washers 5.3
- 4 x wall anchors Ø 8 mm, plastic

Wall mounting

1. Remove the wall bracket from the housing (Fig. 7A)
2. Press the two snap hooks (1) outwards
   ⇒ The wall bracket snaps slightly downwards.
3. Push the wall bracket downwards (2) to clear the housing and tilt it out (3)

Drill the holes

1. Use the wall bracket as a drilling template to mark the positions of 4 drill holes. (Figure 7B)
2. Drill the holes: Ø 8mm (5/16"), depth = 50mm (1.96")
3. Screw the wall bracket into position using the washers provided. If needed, use the wall anchors provided.

Re-attach the controller

1. Hook the bottom of the housing (1) into the wall bracket (Figure 7C)
2. Lightly press the housing at the top (2) against the wall bracket
3. Then check that the housing is hooked in at the top and press down (3) until it clicks into place.
6.2.2 Factory Panel Options

Custom panels are available from the ProMinent facility in Pittsburgh.

The panel mounted DCM includes outlet plugs and a configurable probe header.

Probe header options include a flow switch, Free Cl2, Total Cl2, pH and ORP sensors.

6.2.3 Water Sampling

Best results for controlling the water chemistry in your pool or spa will always depend on the sample water for the sensors being representative of the water in the pool or spa. For consistent and stable sensor readings, it logically depends on the sample water being stable in flow and pressure at rates that are ideal for sensor performance. Vacuum or changing sample pressures will pump the reference electrolyte from the sensors and cause premature failure of the sensors. Entrained air in the sample stream will affect all residual readings and must be avoided or eliminated. pH, ORP and Temperature sensors are not usually affected by entrained air.

6.2.3.1 Sensor Requirements

Residual sensors, Free Chlorine, Total Chlorine, Bromine, etc. are the most sensitive to pressure and flow. The ideal pressure is never under vacuum, always slightly positive, and as low as possible to obtain 10-12 gallons per hour. Pressure should not exceed the 1 bar (15 psig) limit for the modular DGMA sensor holder. If the sample is under vacuum or the flow rate or pressure varies, so too will the residual sensor readings.
Less sensitive to flow are the pH, ORP sensors. Flow rates can be higher, as much as 2-3 GPM, as long as the pressure is under 15 psig and is constant and representative of the pool water. pH and ORP are still affected by pressure changes and vacuum sampling which will cause erratic readings and drastically shorten sensor life.

Temperature and Conductivity sensors are not sensitive to flow or pressure. They only require that the sample be representative of the treated water.

6.2.3.2 Sample Source and Return

Sample water for the sensors should always be filtered water from just downstream of the system filters. It is important to eliminate any small debris that might damage the glass or membrane sensors or clog the small ports in the sample housing or the flow meter / flow switch. The sample rate is ideally 10-15 gallons per hour or only 0.17 to 0.25 gallons per minute. Creating a differential pressure enough to cause this small amount of flow should not be difficult. Returning the sample to as far downstream as possible and after all other devices (i.e. Heater, UV system, etc.) should assure enough differential pressure.

Some unique installations have high backpressures that exceed the limits of the sensors (like high pressure water features such as high waterslides or high pressure spray pads). These types of applications will need special consideration for sampling the water. Contact your ProMinent distributor or the ProMinent Help Desk at the phone number located on the back cover of this manual.

Please look at the sample diagrams below for suggested sample locations for Pressure or Vacuum filters.
Figure 8A. Recommended Pressure Filter Sample and Return locations with Interlocks.
Figure 8B. Recommended Vacuum Filter Sample and Return locations with Interlocks.
6.2.3.3 Optimizing for Accuracy and Repeatability

Accuracy of DPD tests and Amperometric Sensors

Your calibration can only be as accurate as the tool used to calibrate the instrument. The published accuracy of ProMinent residual amperometric sensors is typically the same as the published accuracy of the best available digital colorimeters being used to calibrate them (+/- 0.04 ppm for high quality DPD colorimeter). That means, under perfect conditions for both measurements, if they each have an error of 0.04 ppm, the next reading could still have as much as 0.08 ppm difference. If the DPD test method is not an electronic colorimeter, the errors can be +/- 0.2 or much higher, when using the human eye as the color comparator.

Accuracy Effects on Combined Chlorine Readings

You may see an impossible situation, especially during UV operation and chloramine control, where the Total Chlorine sensor measurement is less than the Free Chlorine measurement, with a perfectly calibrated and functional set of sensors. This situation cannot be seen on a DPD test kit, because the color change in DPD for Total Chlorine is additive to the Free Chlorine color change, so the minimum reading for Total Chlorine is the value of the Free Chlorine test.

Keep in mind that the DCM510 uses two separate sensors for Free and Total Chlorine. It also uses the same simple formula to calculate the combined chlorine residual (Total Cl₂ - Free Cl₂ = Combined Cl₂), and cannot be more accurate than the standards used to calibrate them. Using the accuracy example above, if all the errors of both the Free and Total Chlorine residual are added, the error for the combined chlorine reading may differ as much as 0.16 ppm under perfect conditions. Under practical day to day sampling and testing operations variations of +/- 0.5 ppm is very common. By definition, Free Chlorine cannot exceed Total Chlorine, but measuring accuracy limits as described, can cause this. Close examination of the difference between the Free and Total Chlorine sensor readings may indicate a negative Combined Chlorine reading. To reduce confusion in situations like these, the DCM510 Combined chlorine calculation is not allowed to show an undefined negative combined residual.

Another phenomenon seen with real time residual readings is the chemical and sensor reaction times which occur faster with Free chlorine than Total residual. This can be seen immediately after chlorine feed events, when Free residual readings temporarily register higher than Total residual readings. This is especially noticeable with dry chlorine products due to the time needed for the chlorine to fully dissolve and combine. Once the Total residual species reactions are completed, then Total residual sensor readings return to normal. This is another good reason to not attempt hasty calibrations while chemistry is changing.

Conditions that cause DPD test inaccuracy

- Human eye sensitivity as color comparator
- Poor cleanliness of sample vial – clean regularly and replace when discolored
- Inadequate rinsing of sample vial between samples – 4-5 minimum
- Variable Total chlorine test timing – waiting the full 180 second reaction time?
- Varying sample volumes-top or bottom of meniscus?
- Varying reagent metering – dropper vertical?
- Aging reagents – fresh is always better
- Contaminated reagents – store as recommended, not out on the pool deck
- Aging or dirty comparator – Standards must be kept clean and an electronic comparator needs to have its lenses cleaned periodically-read the owner’s manual
- Colorimeter calibration/alignment – read the manual for recommendations. If it has been dropped, it may no longer be accurate.

NOTE: Your DPD tester will have instructions for how to properly use and maintain your instrument to obtain optimum results. Read these instructions carefully and follow them to the letter, including the newest sequences of reagent first, then water sample introduction, vial cleaning, reagent shelf life and storage.
6.2.4 Sensor Installation

Note: If this is a new installation, be sure that circulating sample water is available during and after sensor installation as the sensors must be kept wet and they will take a number of hours to equilibrate and run-in. Additionally it is advised that the sample water be allowed to flow before being connected to the supplied DGMa hardware to eliminate any debris that might clog the small openings in the valves and sensor chambers. If this is not done, the debris from installation of plumbing, filter sand and other trash will be washed into and clog the DGMa. This will necessitate the complete disassembly and cleaning of the modular sensor housing. While this is not difficult, due to the modular design of the individual cells, it is time consuming.

6.2.4.1 Factory Installed Sensors

The factory installed sensors are connected and placed in the DGMa sensor holder but they are not yet ready to use. They must be “charged” with electrolyte before they will measure and react to changes in chlorine or bromine residual. The exceptions are the conductivity and temperature sensors which do not need to be charged, nor require constant moisture.

6.2.4.2 Field installed Sensors

The coaxial cables used to connect the pH and ORP sensors are normally pre-installed at the factory with the sensor type written on a label near the orange SN6 connector. pH and ORP sensors are shipped in individual boxes and their tips are protected by a moisture sealed cap that contains liquid electrolyte. When you are ready to install the pH and ORP sensors, follow the cleaning and rinsing procedure below. While just inserting the pH and ORP sensors into the DGMa modular sensor housing is acceptable, cleaning the sensors prior to first installation will dramatically speed up the sensor equilibration.

Pre-Cleaning pH and ORP sensors:

Remove the protective cap with the tip of the sensor down to avoid spilling the electrolyte. The electrolyte is a non-toxic, potassium chloride silver chloride salt solution. Use a soft bristled toothbrush and a few drops of 95% isopropyl alcohol (no additives) to remove the coating of plasticizing chemicals. Rinse the sensors with an acidic solution using the same soft bristled toothbrush. Any acidic solution will work, vinegar, acetic acid, Lime Away©, or CLR©, etc. pH and ORP sensors react faster when recovering from an acidic rinse solution.

Installing the pH and ORP sensors:

Be sure the petcock is open so that you are not forcing the sensors against pressure created from a closed housing. Place the O-rings (4) and compression rings (5) as shown in the drawing on both sensors before inserting into the cell. All 25mm sensors (residual, pH and ORP) use the same O-ring arrangement. Install the pH sensor above the Temperature (SGT or PT1000) sensor in the same cell. The ORP sensor is installed in the most downstream cell in the assembly, usually the one with the sample petcock. Turn on the sample water as soon as the sensors are installed, so the liquid junctions do not dry out. Adjust the sample flow rate to the guidelines below.

6.2.4.3 Vacuum and Pressure

Caution must be exercised when installing or removing the sensors in or from the DGMa sensor housing. Sensor membranes can be damaged by forcing the sensors into or out of the housing against pressure or vacuum caused by closed valves and no way of relieving the pressure or vacuum when sensors are inserted or removed. Open the sample Petcock before removing or installing sensors in the DGMa sensor housing to allow pressure to equalize as the sensor is changed.

6.2.4.4 Optimum Sensor Order

Residual sensors function by measuring the current used to reduce the sample presented to them. If the flow of the sample increases, the amount of chlorine presented increases, and so then does the reading shown. That is the reason the residual sensor accuracy is flow dependent, where pH, ORP and temperature sensors are not.
When samples are taken using the sample petcock, flow will increase across the tips of the sensors and so too can the residual readings. Placing the residual sensors as far upstream from the sample petcock will minimize this effect, but it will not eliminate it. Since the Total Oxidant sensors (CGE, CTE, and BRE) are the most sensitive to these changes, they should be mounted the farthest upstream in the DGMa Sensor Housing. The Free Chlorine sensors (CLE and CLO) should be mounted next farthest from the sample petcock.

6.2.5 Maximizing sensor accuracy

As we saw in the sensor installation section, all sensors are adversely affected by excessive pressure, pressure changes and especially negative pressure (vacuum). Since the non-temperature sensors all have an internal electrolyte at atmospheric pressure, any negative pressure or frequent pressure changes on the sample stream will effectively suck or pump the electrolyte out of the sensors. Since this electrolyte is critical to sensor readings, any negative pressure will not only affect the readings, but it will deplete the electrolyte and require frequent sensor rebuilds (residual sensors) or sensor replacement (pH and ORP). Sensors are not warranted under these conditions.

6.2.5.1 pH Compensation

Free Chlorine residual sensors (CLE and CLO) use pH compensation. Any pH sensor calibration adjustments will therefore affect the Free Chlorine residual calibration. For this reason Calibrations of Free chlorine sensors require that the pH sensor be calibrated before the free residual sensor, otherwise pH calibrations performed after the Free Chlorine calibration will shift the Chlorine calibration.

6.2.5.2 Sample Flow Rate and Stability

Optimal sample flow rate for residual sensors is 10-15 gallons per hour. The residual sample accuracy is very dependent upon the sample flow rate, so any change in flow rate since the last calibration will be seen as a change in the residual reading.

A common misunderstanding by new users is the reading on the DGMa’s flow meter and switch. The flow meter uses a plastic float to indicate the flow through the sensor housing, where the top of the float indicates the flow rate next to the markings on the body of the flowmeter cell. The switch portion of the meter is the plastic shaft inserted from the top of the cell so that the magnet embedded in the float activates the flow switch.
A common example of a way the flow is improperly adjusted: The inlet and outlet valves are fully open and the flow through the sensor housing is at maximum, but the flow switch float is restricted by the switch shaft so it improperly shows ~12g/h (0.2 gpm), although the actual flow may be several times that because the float is prevented from rising higher and showing the actual flow.

If the flow is properly adjusted, the float is barely touching the bottom of the shaft, and any slight restriction of the flow valves will cause the float to fall away from the shaft. Secondly, it is important that the sample flow at the petcock should be a slow trickle, enough to take a sample but not a vigorous stream, and never a vacuum, where opening of the petcock draws air into the sample stream. A vigorous stream indicates excessive backpressure that must be eliminated. The DGMa modular probe housing is designed to withstand 1 bar [15 PSIG] pressure under normal operation.

This proper flow adjustment is important because any inadvertent increase in sample flow will cause the residual reading to increase with respect to the actual residual in the water. If this occurs, and the residual sensor is being used to control the chlorine, the actual residual will drop as the inflated sensor reading is used to achieve setpoint. Conversely, if the residual sensor is calibrated at the higher flow rate the actual residual would increase with respect to the sensor reading.

6.3 Electrical Installation

User qualification, electrical installation Electrical technician, see Section 4.5 Users’ qualifications

**NOTICE**

Moisture at the contact points

It is important that you use suitable measures to protect plugs, cables and terminals from moisture and potential corrosion. Moisture at the contact points can interfere with the operation of the controller.

**WARNING!**

Safe operating status

Both hardware and software safety precautions must be taken to ensure that the DCM510 adopts a safe operating condition in the event of a fault.

Use limit switches, mechanical locks, and other appropriate safety devices.

During installation the device must not be electrically live.

The installation must only be carried out by technically trained personnel.

Observe the technical data in these instructions.
6.3.1 Specification and location of the cable grips and conduit entries

Figure 12  All Dimensions in millimeters (mm)
6.3.2 Sensor Seals and Termination Procedure

Select the correct fitting cable glands (cord grips) for the controller’s cable openings. Seal the open holes with blanking plugs (1) in the cord glands as shown. This is the only way to ensure an acceptable air and moisture seal. Non-sealing dust caps are not effective for preventing non-warranty damage from moisture, corrosion or insects. Standard sizes for the cable glands are the metric sizes M12, M16 and M20.

Figure 13B Examples of cable gland assembly.
6.3.3 Parking the Hood

The hood, also called the lid or cover, of the DCM510 enclosure can be ‘parked’ so that access to the internal wiring and all of the display indications are accessible simultaneously as shown below. To park the hood, loosen the four captive screws until the hood can be carefully pulled straight out from the enclosure base. Note the plastic brackets attached to both sides of the lower portion of the hood, and the slots they were removed from. Notice identical slots higher on the base that the hood can be inserted into. Carefully insert the brackets into the slots until they click and seat.

- Guide the cable into the controller.
- Connect the cable as indicated on the terminal diagram
- Tighten the clamping nuts of the threaded connections so that they are properly sealed
- Place the hood onto the lower section of the housing. Check for wires on the perimeter
- Manually tighten the housing screws
- Check once again that the seal is properly seated.
- The degree of protection IP 65 (NEMA4X) can only be assured if the hood perimeter seal is installed correctly.

Figure 14. Hood in the parked position

As with most electronic devices, moisture in the controller can lead to operational abnormalities and damaging corrosion. Note the instructions on the terminal diagrams provided.

6.3.4 General Layout and Terminal Diagrams

Figures 15 through 18 show general position of electronic components and wiring terminations.

Figure 15 shows the position of the internal relay indicators for each relay R1 through R9. These lights are repeated on the controller cover.

Figures 16A, B and C show general component layout.

Figures 17A, B and C are electrical schematics of the I/O.

Section 6.3.5 depicts wiring rules and examples.
Figure 16B  DCM510 overall location of major components
Figure 16C  DCM510 motherboard general arrangement
Figure 17A  Main PC board Input Wiring diagram
Figure 17B  Main PC board Output Wiring diagram; Part 1: Relays R3 through P9
The ground and neutral connections are all tied together through the printed circuit board as shown in the schematic 17C. The hot (Line) wire does not link with the other L terminals until after it passes through the main fuse F3.

Main power is terminated on the bottom rung of the Power block marked IN in figure 17D.

See section 6.3.5 Power In and Relay Output Termination
6.3.5 Power In and Relay Output Termination

All electrical wiring shall be performed by a licensed electrician, in accordance with local and national electric codes.

The following wiring diagrams and information show typical configurations, but not all the possible combinations of this versatile controller.

6.3.5.1 Overview

The power/relay section of the controller is shown in Figure 18 without wiring. Here we can see the labels on the controller circuit board indicating (from right to left) power in, power out and relays R1 through R5. See also figures 17B and 17C.

The two large orange terminal blocks on the right each have 3 levels; Line, Neutral and Ground (PE). Input power is connected to the right most row of the Power block. See Figure 20.

In the USA, this connection is prewired in the factory for use with 120VAC. However, the input power supply will accommodate 120VAC at 50 to 60 Hz. No controller AC power configuration is required. Use wire/cables/plugs that are matched to the power you are using. See also 6.3.6.4 Connecting a Power Cord.

Input power is fed through the circuit board to the Relay Fuse located above the Power block, then back to the Power block’s three output terminals. (See Figure 19) The main circuit board under the Power block ties all 4 Neutrals together and all 4 PE (ground) terminals together. (See figure 17B)

The three fuse powered outputs can be used to power the dry contacts on relays R3, R4 and R5. See also Figure 25.

Fused power is also connected to the common inputs of R1 and R2 (not shown). These relays are ‘powered’ relays. See Figure 17B

All 5 relays can be used for pumps and solenoids as well as motor operated valves (MOV). MOV terminations are explained in section 6.3.5.3 Wiring Relays R1 and R2 for a Motor Operated Valve, and section 6.3.5.5 Wiring Relays for Externally Powered Motor Operated Valves (MOV).
To enter wires into the terminal blocks, (see figure 22) insert a small screwdriver or similar, into the spring box slider as shown, then push up on the driver handle. This will force the spring loaded metal slider downwards and open the wire grip in the wire slot below.

To enter wires into the digital inputs and digital outputs, depress the spring loaded tap. See figure 21

6.3.5.2 Wiring Relays R1 and R2

**CAUTION!**

All electrical wiring shall be performed by a licensed electrician, in accordance with local and national electric codes.

**NOTICE**

The control relays R1 - R5 are rated at 10 Amperes. While typical feeders used are AC line powered, some are connected to a DC power supply (look for DC motors or solenoids in the device) that can have an inrush current 100 times larger than the AC current rating. If this inrush current exceeds the 10A rating of the relays, it can damage the chemical feed relay and could cause the relay to fail. Be sure the feeders you connect are compatible. Contact ProMinent with questions.

Notice that the black, white and green wires for R1 are in the right most column of the terminal block, the NO (Normally Open) column. Relay R2 also utilizes the NO column. These plugs will supply power when the controller turns them on.

Powered relays R1 and R2 are designed to operate pumps and solenoids with a 1 amp rating or less. Relays R3, R4 and R5 can drive 5 amp devices. See section 6.3.5.5 Wiring Relays R3 – R5 Using an External Power Supply.

6.3.5.3 Wiring Relays R1 and R2 for a Motor Operated Valve

*Motor Operated Valves are not common in Aquatic applications.*

Motor Operated Valves typically have two hot wires, a neutral and a ground. The two hot wires will be terminated on the NO and NC terminals. The NO terminal will open the valve when the controller turns on the output relay. The NC terminal will close the MOV when the controller turns off the output.

Figure 24 shows an MOV terminated on R1. The red wire is connected to R1 NO and the black wire is connected to R1 NC. See also section 6.3.5.6 Wiring Motor Operated Valves (MOV) to Relays R3 - R5

6.3.5.4 Wiring Relays R3 – R5 Using On-board Power

Terminal connectors for R3, R4 and R5 can be removed from the PCB by pulling them up and off the pins on the PC board to make wiring easier, if you choose. Terminals for relays R1, R2 and the power block cannot be removed.
Mounting and Installation

CAUTION!

The unpowered (DRY) relays R3, R4, and R5 are not fused and any external connection to these relay terminals will require additional circuit protection provided by the installer at the time of installation.

Failure to protect these circuits can cause non-warranty equipment damage and could pose a safety hazard.

Relays R3, R4 and R5 have Dry Contact terminals. Unlike R1 and R2, they have no power. This allows the user to supply power from a remote source or use power from the Output side of the power block. It also allows these 3 relays to be used as an unpowered (dry) switch contact.

In Figure 25, we show a jumper wire from the Fused Power output block Line terminal to the Com input on R3 – the left terminal. The NO terminal is used to power the outlet plug – Center terminal, also black wire. The White and Green wires, Neutral and Ground respectively, are connected to the N and PE (Ground) connections on the Power output block as shown.

6.3.5.5 Wiring Relays R3 – R5 Using an External Power Source

CAUTION!

The unpowered (DRY) relays R3, R4, and R5 are not fused and any external connection to these relay terminals will require additional circuit protection provided by the installer at the time of installation.

Failure to protect these circuits can cause non-warranty equipment damage and could pose a safety hazard.

An external power source can be used on relays R3, R4 and R5. Figure 26 illustrates an external voltage connected to relay R5 at the COM terminal (black wire). A second wire (red) on the NO terminal is the switched output to a pump, solenoid, alarm light, etc. The neutral and ground wires for an externally powered device must not be terminated in the controller.

Figure 25  Wiring R3 using on-board fused power

Figure 26  Remotely powered relay
6.3.5.6 Wiring Motor Operated Valves (MOV) to Relays R3 - R5

Motor Operated Valves are not common in Aquatic applications.

Motor Operated valves typically have two hot wires, a neutral and a ground. The two hot wires will be terminated on the NO and NC terminals. The NO terminal will open the valve when the controller turns on the output relay. Figure 27 shows internal power used on R3 and external power used on R5 to control an MOV.

6.3.5.7 Connecting a Power Cord

CAUTION!
All electrical wiring shall be performed by a licensed electrician, in accordance with local and national electric codes.

The default configuration of the DCM510 controller has a power cord already attached as described below. These instructions should only be needed if for some reason the controller is a replacement for the original that does not have a power cord installed.

Remove a knock-out from the bottom of the controller and install the cord using a NEMA4/IP66 cord grip as shown in figure 28. See also Figures 13A and 13B along with section 6.3.2 Sensor Seals and Termination Procedure.

Terminate the line, neutral and ground wires as shown in figure 28. See also Figure 22 in the overview section to open the terminations.

6.3.5.8 Converting from Power Cord to Conduit Connection

With the power cord unplugged, remove the power cord connections from the Line, Neutral and Ground terminals. Remove the cord grip as shown in Figure 28. See also Figures 9 and 10 and see Section 6.3.2.

Terminate the line, neutral and ground wires as shown in Figure 28. See also Figure 22 in the overview section to open the spring loaded connector terminals.
Mounting and Installation

6.3.5.9 DC Output Control Termination

Outputs 6 through 9 are unpowered (dry) solid-state digital outputs rated for 24VDC / 250mA which can be configured as a Pulse, ON/OFF or Enable/Disable output. See Figure 29A.

In **pulse mode**, these outputs can control the speed of pulse driven pumps like the ProMinent Beta series of pumps. The frequency outputs vary the pump speed in much the same manner as a 4-20mA signal.

In the **ON/OFF** mode, the outputs can start/stop a pump or other chemical feeder. The feed rate will then be determined manually at the feeder.

These outputs can also be used to **enable/disable** a remote device like a heater or UV System’s pause or second setpoint feature.

**6.3.6 Using a ‘Pulse’ Output Relay**

ProMinent pump types, Beta, Delta and Gamma using a Universal Control Cable will terminate with the brown, black and white wires as shown in Figure 29B. This connection is not polarity sensitive. The brown/black wires are shown in the A terminal. They could be in the B terminal.

The black is common. The white wire is used for the pulse signal. The brown wire is for pause/enable. The brown and black wires need to be connected to enable the pump. The enabled pump will stroke each time the white and black wires are shorted through the relay.

Figure 29C depicts a Concept termination for Pulse Mode pump control.

**6.3.7 Using an “ON/OFF” or “Enable/Disable” Output Relay**

ProMinent pump types, Beta, Delta and Gamma using a Universal Control Cable will terminate using the brown and black wires as shown in Figure 29D. This connection is not polarity sensitive. The black is common. The brown wire is for pause/enable. When the brown wire is not connected to the black wire, the pump will be in pause mode. In the configuration shown, the controller will be enabled or “turned on” each time the P7 output closes, and will PAUSE whenever P7 turns off.

A Concept pump uses the same color code for pausing the pump. However, the action is opposite. When the wires are shorted through the relay, the pump will pause. When the relay is open, the pump will run. See Figure 29E.

**6.3.8 ProMinent Control Cables Available**

Universal control cable for ProMinent Beta, Delta and Gamma pumps have this configuration.

Figure 30A
With Concept Plus pump speed knob in external position, black and blue are the pulse signal input. With pump in manual mode, black and brown will pause the pump when connected. See Figure 30B. 

This is the opposite function of the pause function on other ProMinent pumps using the universal control cable.

### 6.3.9 Wiring sensors to the controller

**NOTICE**

Poor electrical connection may cause incorrect measurements. Once a wire is terminated, tug gently on the wire to ensure it is firmly connected.

Signal inputs to the controller attach to the main printed circuit board (PCB) or to expansion driver cards. See Figure 36. Each analog input (sensor) signal as well as all 4-20mA output signals are each assigned a letter, A through N, for program identification. Digital (contact) inputs are assigned a letter from O through Z. Digital outputs are assigned numbers 1 through 9.

In this way, outputs may be programmed to operate based on the status of specified inputs. Relay 3, for example, might be energized when sensor E reaches a programmed setpoint. Analog outputs (4-20mA) can be programmed to vary proportionally to an analog input in a forward or reverse direction. Refer to section 10.25 4-20mA Outputs for programming detail.

#### 6.3.9.1 Inputs on the Main Board

The main PCB inputs are shown in Figure 31.

**Figure 31 Main board inputs**

Inputs A and B are ProMinent serial sensor inputs. Serial sensor choices currently include CTFS (Conductivity, Temperature, Flowswitch – Serial) and LogR serial corrosion sensors. These sensor have 3 wires; transmit, receive and common. Do not connect other probes to these inputs. Notice the color code of the wires is stenciled on the main board. The A input (figure 31) has a serial sensor attached to show the wire color matching the stencil; red, black and green.

Additional serial sensors may be added to the controller via serial expansion driver cards. See section 6.3.12 Dual Serial Input card (CTFs-LPR-DP)

**NOTICE**

The CTFS sensor is not the same as a CT sensor. The DCM510 customers rarely use the 4 wire CT sensor. The more commonly used conductivity temperature (CTFs) sensor has 3 wires and is compatible with inputs A or B.

See section 14 Spare Parts and Accessories for a list of DCM510 compatible sensors.
6.3.9.2 The G input (4-20mA)

The G input is a passive input for 4-20mA devices. This means there is no power supply provided to power the 4-20mA transmitter generating the signal. Active, or powered loop devices, may include UV intensity % or W/m² signals, turbidity, flow rate, temperature, analog tank level, or other analyzer signals, etc.

If the sensor is also passive, an external 12-24VDC power supply can be used and should be rated for 50mA minimum.

The G input is not configured for ProMinent amperometric sensors including pH and ORP sensors that have been converted to a passive 4-20mA. These sensors require the optional 4-20mA expansion input card covered in section 6.3.11 Sensor Driver Cards.

Figure 32 shows an example of a 4-20mA input wired to the G input where the red wire is the sensor + (plus) and the black wire is the sensor – (negative) conductor.

Temperature compensation cannot be applied to this input, because the influence of the temperature measurement on the measured value is not known.

6.3.10 Temperature - Input H

The DCM510 has four ways to input temperature readings. Serial conductivity sensors (CTFs), 4-20mA input cards as an analog signal, the temperature terminal (on the ORP/pH card) or the H input. These inputs are not universally compatible with all ProMinent temperature sensors.

The H input is compatible with the following sensor:

Part # 1051505 SGT Solution Ground/Temperature (LM335 type) 10mV/°K sensor

Any temperature input can be used for temperature display, control or compensation. The Pt-1000 temperature input on the pH driver card (XE4) is the default temperature sensor from the factory. A disconnected sensor will show over 300°F, and a shorted input will show about -8°F.

A 1KΩ test resistor placed across the H input will display about 32°F depending on the resistor tolerance. An open circuit will show about 277°F. 1500Ω will net about 88°F. See Figure 33.

Digital Inputs O through V

Inputs O through V are digital inputs. They designed to monitor dry (unpowered) contact signals from flowmeters or any dry contact switch or relay contact. See figure 31. Wire the input between the + and – terminals. See figure 34. Black is on + and white is on –, but polarity is not important on these inputs. Each input has a ~16 volt (+V) terminal available as a power source for the sensor or input device. These unused power sources can also be used to power a 4-20mA loop for the G input. See section 6.3.9.2 The G input (4-20mA).

Digital flowmeters that use these terminals must not supply a sine wave or powered signal. If the meter uses a ‘square wave’, ‘open collector’ or ‘dry contact’ output, you can connect to these inputs. Signet 2536 “blue cap” or 2551-XX-11 water meters with a square wave pulse output are compatible and commonly used in aquatic applications. Signet 515 red cap and similar sine wave output meters are not compatible with these digital inputs. Many other brands and models like Seametrics are also compatible.

Various types of flowmeters use the V+ terminal. The color and purpose of the wires does not adhere to a standard. Some meters use black for power and red for the signal. Check the flowmeter manual.
6.3.10.2 Namur Inputs U and V

Inputs U and V are digital inputs that operate as mentioned above and can be used in some explosion proof applications. See section 5 Functional Description for specifications.

CAUTION!

Explosion proof wiring and systems should be designed, installed and inspected by specially trained personnel.

6.3.11 Sensor Driver Cards

The following sections identify wiring diagrams of the sensor driver cards. There are three available expansion slots as shown in section 6.3.4 General Layout and Terminal Diagram.

NOTE: The drawings show the location of connections and are meant to be used with the adjoining tables which provide additional information for wiring connections.

There are currently six expansion cards to choose from. Each is described in detail below.

Dual Serial Input card (CTFs-LPR-DP)
Dual CT (Conductivity/Temperature)
Dual pH-ORP-Temp Driver
ORP/pH Temp mA Input card
Dual 4-20mA Input Driver
Dual 4-20mA Output Driver

The three expansion slots are shown in figure 36 and figure 15B.

Note the letter designations in yellow. Inputs on these cards will be identified in the program by these letters for clarity.

Figure 35 Temperature, Sample Flow Switch and commonly used Signet 2536 water meter wiring connections.

Figure 36 Expansion Card Slots and Letter Designations
6.3.12 Dual pH-ORP-Temp Driver

Two inputs; can both be pH or both be ORP, or one of each. Any 2-wire pH sensor will work if the mV/pH is ~59.1. Any 2-wire ORP will work if mV is in the range of +/- 1,000mV.

The pH, ORP or temperature (Pt100 or Pt1000 only) sensors can be extended a maximum of 10 meters/30 feet from the controller. For longer distances, use a 4-20mA sensor transducer and a 4-20mA input card.

Temperature can be used for display, control or compensation.

This card is not compatible with our 'SGT' Solution Ground/Temperature sensor.

If an electrical potential exists in the water, it should be removed. If it cannot be removed, a potential equalization electrode (also called “liquid potential” or “solution ground”) connection can be used. If a potential equalization electrode is used, the default wire jumper(s) on XE3 and XE7 must be removed before connecting the potential equalization electrode to input XE3:2 and/or XE7:2. If not using a potential equalization electrode, leave the default jumpers in place on XE3 and XE7.

**NOTICE**

Jumper and potential equalization (liquid potential or solution ground).

If a “liquid potential” jumper and a potential equalization electrode are both or neither connected, it will cause incorrect sensor readings.

Always leave the jumper connected if not using potential equalization, or remove the jumper when connecting potential equalization.

**Table 7  Dual pH-ORP-Temp Connections**
6.3.12.1 Attaching the pH/ORP coax cable.

Once the cable has been prepared, (Figure 50) attach it to the pH/ORP driver card. Remove the shield grounding nut, XE5, and loosen the center conductor screw, XE6, as shown in Figure 47.

Insert the coax center conductor into the XE2 or XE6 terminal and tighten. Place the shield grounding nut on the post, screw down and tighten. This nut is smooth for a reason. Do not over-tighten!

When is potential equalization (Solution Ground) used?

Potential equalization (also called “liquid potential” or “solution ground”) is used if the pH/ORP measurement is interfered with by disturbance potential (millivoltage) from the measurement media (water). For example, a disturbance potential can be caused by electric motors with incorrect interference suppression or due to insufficient galvanic isolation of electrical conductors etc. Potential equalization does not remove this disturbance voltage, it just reduces its effect on the measurement by compensating for it. Therefore, it is ideal to remove the source of the disturbance potential.

Ready-made coaxial cable

Whenever possible, only use ready-made coaxial cables that you can select from the ProMinent catalog.

- Coaxial cable 0.8 m-SN6 (31.5”), ready-made, order no. 1024105
- Coaxial cable 2 m-SN6 (6.5”), ready-made, order no. 1024106
- Coaxial cable 5 m-SN6 (16.4”), ready-made, order no. 1024107

Figure 47 pH/ORP driver card coax connection

Figure 48 Coax placement

Figure 50A Coax cable preparation with conductive sleeve (wrong)

Figure 50B Coax cable preparation with conductive sleeve removed
Coax cables accompany pH and ORP sensors when shipped with a DCM510 system. They are also pre-wired at the factory during production. If you shorten or replace them, be sure to create an end that is a good fit for the card termination.

Remove the black plastic layer from the inner coaxial cable. This is present on all types of cable. In doing so, ensure that individual threads of the bare wire shielding do not come into contact with the inner conductor or its terminal screw.

6.3.13 Dual 4-20mA Input Driver

The dual 4-20mA input card can handle active and passive loops. Both inputs are isolated from each other and the motherboard.

Any 4-20mA input is acceptable; however, there is no square root operation as found in some older flow meters.

Enter any engineering units for the range. 4mA does not have to be 0.

Maximum load per loop is 50mA. Short circuit proof at 70mA. Reactivation after 10 seconds. ProMinent recommends a maximum length of 1,000 feet using 22 AWG wire or larger. Twisted, shielded, stranded cable is best for long distances.
6.3.14 Connection of Amperometric Sensors

ProMinent amperometric sensors were designed be connected to our 4-20mA input driver card. Connect the sensor, as described below.

**Note:** if connecting a non-powered sensor to G input you will need to use 15VDC power supply from either one of the digital inputs or an external power supply. If power is sourced from a digital input, the digital inputs will no longer be isolated from 4-20mA input G, since they are sharing the same power supply. For this reason, we will not use the G input for ProMinent amperometric sensors. A UV system like our Dulcodes series can provide a 4-20mA output showing the UV lamp intensity.

Table 10 Dual mA Input Connections

Pin 1 on the ProMinent amperometric sensor is connected to the V+ terminal

Pin 2 on the sensor is connected to the ‘IN’ terminal

Shown connected to XE1

Figure 55 Amperometric probe to 2mA 4-20mA Input Driver

Figure 56 Three wire 4-20mA inputs that utilize V+

**NOTICE**

Analyzers and computer systems, DCS, PLC, etc., typically use 120VAC. Therefore, 4-20mA signals from these devices can be active or powered by the supplying device. The 4-20mA signals often have the option to allow the current loop to be powered from the receiving end. In this case, the receiving end is this DCM510 series controller.

The purpose of this page is to show how to wire inputs from devices that need to be powered from the controller, figures 55 and 56, and inputs that are powered remotely, figure 57.
Milliamp inputs from powered devices do not need on-board V+. The + wire from the Input device, (analyzer, PLC, etc), connects + wire to the "IN" terminal and the – wire to the "GND".

6.3.15 Dual 4-20mA Output Driver

Two outputs fully isolated from each other and from the mother board.

Output open loop alarm; Maximum load of 450ohm @ 21.5mA, 480 ohm @20.5mA. Drive voltage maximum; 18VDC open circuit. We recommend a maximum length of 1,000 feet using 22 AWG wire or larger. Twisted, shielded, stranded cable is best for long distances.

Does not have a passive output. The loop is powered by the driver card. Scale to any engineering units, direct or inverse.

Examples:
- 4mA = 0 GPM and 20mA = 200 GPM
- 4mA = 200 GPM and 20mA = 0 GPM
- 4mA = 32°F and 20mA = 212°F
- 4mA = -500mV and 20mA = 500mV

Can be used for proportional control of a pump or analog valve. Can be used as a process variable to a DCS or chart recorder.
The dual 4-20mA output driver is equipped with onboard power which is used to power or excite the output loops. Therefore, the input device must not power the loop. mA loops cannot be powered from two sources!

### 6.4 Dual Pool Considerations

One of the significant improvements to the new DCM510 platform is the ability to control two bodies of water in a single controller. This can typically be two pools, two spas or a pool and a spa.

While the DCM510 now has the capability to measure and control two bodies of water, it does not have unlimited inputs and outputs. Considerations must therefore be made when deciding to control two bodies of water with a single controller. There are up to 3 dual analog input slots available for a total of 6 analog sensors, plus the temperature inputs that accompany pH and conductivity inputs.

A good use of all the sensors available might be: Control two indoor pools, each with pH/Temperature, ORP, and Free Chlorine sensor. That is shown as Configuration #1 below.

Another option utilizing all 6 analog sensors available might be each pool having pH/Temperature, Free and Total Chlorine, eliminating ORP. This combination allows the automatic calculation, and display of Combined chlorine. If using an Ultraviolet treatment system, Chloramines can then be controlled. This configuration is shown as Configuration #2 in the chart below.

Additional possible combinations are also shown in Configurations 3 and 4 below.
6.4.1 Dual Pool Sensors

All of the sensors available for a single pool are available for the dual pool configurations. The only limitation is the total number of sensor inputs and the associated control outputs needed. There is a lot of control flexibility with 9 control relays. The 9 includes 2 dedicated AC line relays, 3 dry contact mechanical relays that can be easily configured for AC or DC, and (4) 24 VDC solid-state contacts that can be used as an enable/pause output or a pulse output, to control pump speed with proportional or PID.

6.4.1.1 Example Dual Pool Configurations

![Figure 61A 2x pH/Temp, 2x ORP, 2x Free Cl](image1)

![Figure 61B 2x pH/Temp, 2x Free Cl, 2x Total Cl](image2)

![Figure 61C 2x pH/Temp, 2x Free Cl](image3)

![Figure 61D 2x pH/Temp, 2x ORP example](image4)

![Figure 62A Dual pool panel layout](image5)
Additional possibilities for combinations of the above configurations are available to meet the demands of your facility.

6.4.1.2 Stacked DGMa

The DGMa modular sensor housing is typically mounted so the flow is left to right with the flow indicator/switch in the left most module. When a dual-pool version is ordered, the typical configuration has the DGMa "stacked" with one pool’s sensors closest to the black polypropylene backpanel, and the sensor housing for the second body of water mounted just in front of the other DGMa, as shown in the SIDE VIEW drawing above. If this arrangement is inconvenient or unworkable, the DGMa sample assemblies can be mounted separately or reversed so the flow is right to left, to meet your needs. If considering separating the DGMa assemblies, keep cable lengths in mind and order longer coaxial SN6 cables, if needed, to accommodate the pH and ORP sensors (10.0 meters, 32.8 Feet Maximum). Residual and temperature sensors will also be limited to the same lengths as the coaxial SN6 cables because of proximity.
6.4.1.3 Temperature inputs

The pH / ORP driver cards utilize a Pt1000 RTD sensor input on the pH channel. This is the default temperature input on the DCM510 series controller. With two bodies of water, if there is a need to display, datalog or control the water temperature of both bodies of water, it will be necessary to use an additional temperature sensor. A default way to accomplish this is to use the temperature input on both the pH input driver cards.

There is another dedicated temperature input on the motherboard of the DCM510 controller, the ‘H’ input. The ‘H’ input is provided only for legacy controller upgrade purposes. The H input, uses a mV/°K sensor with the part number 1051505. These sensors are not interchangeable with the default RTD temperature sensors. The default RTD temperature sensor is part number 1080101.

6.4.2 Salt Generator Pool Considerations

6.4.2.1 Salt Compatible sensors

Some of the standard sensors used in fresh water pools are not compatible with most on-site chlorine generators. Generators that utilize salt dissolved in the pool or spa water create special conditions that require special sensors. Standard Free Chlorine ppm and ORP sensors, when used in salt water pools, will seem to work at first, but will become less responsive in a short period of time. For that special condition we have specific sensors that must be used in salt water applications.

6.4.2.2 Temperature and pH Sensors

Conductivity, Temperature and pH sensors are fairly universal and are not adversely affected by salt water, so there are no special salt compatible sensors for Conductivity, Temperature or pH.

6.4.2.3 ORP Sensors

The platinum element used in standard ORP sensors does not work well in salt pools, so a gold element version of our ORP sensor must be used. The RHEP-Au–SE ORP sensor, part number 1003875, is 13.5mm in diameter, and utilizes a more sensitive gold needle tip.

6.4.2.4 Chlorine Sensors

CLE3 Free Chlorine membrane sensors are not compatible with salt pool chemistry and will need to be substituted with a CLO free chlorine sensor. The CLO sensor is different in that it has a gold tip and no membrane. Contact your ProMinent distributor for more detailed information.

6.4.2.5 Conductivity sensors

Conductivity sensors are more popular in salt pool applications as they allow the user to monitor the salinity level of the water, which is critical for optimal performance of most salt generators. Depending on the sensor combinations, it may be necessary to add a cell to the DGMa sensor housing to accommodate a conductivity sensor. Conductivity sensors do not require a specific orientation as do electrolyte filled sensors, so conductivity sensors use an adaptor to screw into the bottom of one of the 25mm cells as shown below.

![Figure 63 DGMa with Conductivity sensor](image)
7 Communication Hardware

7.1 Diagram of the Communication Modules

See also section 11.1 Communications in the System Menu

Figure 64 Illustration of the various communication ports and modules
8 Commissioning

User qualification: trained user, see section 4.5 ‘Users’ qualifications’.

After mechanical and electrical installation, turn on and purge any debris from the sample stream, so that it does not clog the ports of the DGMa. Verify the sample and return lines are connected to the circulation system where shown in Figure 8A or 8B in section 6.2.3.2. Then connect the sample source tubing to the inlet of the DGMa (look for the flow arrows on the body of the cell modules and follow them). Check for leaks in the sample line and purge any trapped air.

8.1 Switch-on behavior during commissioning

Switching On - First Steps

Power up sequence will first show the 4 line x 20 character LED display for 3 seconds:

```
Powering up... contact set states:
ON = § OFF = §
```

Followed by the “Home” screen of up to 6 sensor readings with the bottom line reserved for labels above the 3 dynamic keys F1, F2 and F3:

```
7.6pH  747mV
80.4F  3.0PPm
360.3pM  0.3pPm
STATUS SETPNT
```

These sensor choices can be changed or rearranged. See section 2.2 Modifying the ‘Home’ Screen.

8.2 Defining Metering and Control Processes

8.2.1 Define the following parameters to set up a controller:

Configuring the controller adapts it to your pool or spa. Planning the configuration before beginning the configuration process could save you lots of time.

- What type of a process control is planned? Single or dual pool? Salt generator? Acid? CO₂?
- Which measured variables are needed?
  - pH, ORP, Free Chlorine, Total Chlorine, Combined Chlorine, Conductivity, Temperature, Water Flow Rate, Water Level control (Auto-Fill) ...
- What other devices will interface the controller? (Chemical Feeders, UV system, Heater, flowmeter, flow switches or interlocks etc.)
- Should the controls operate as ON/OFF, frequency, proportional or PID?
- Which relays or control outputs will be used?
- What control parameters are necessary? Setpoints, alarm points, feed timeouts, deadbands.
- How should any mA inputs or outputs be configured?
- Are there chemicals to be fed using a timer?
- Will you use an alarm relay?
- Will you connect to the building network?

9 Programming the Inputs

This section will depict the keystrokes necessary to edit the program, calibrate sensors or find information.

You can pre-configure your controller to a setup very close to the parameters you need. The Load Configuration feature outlined in section 13.2.2 outlines how many if not most of the settings you need can be pre-loaded. The controller should have a default configuration already loaded at the factory, based upon the model of DCM51x you ordered. If it does not, (it might have gotten reset to factory defaults configuration) then you can easily upload the factory default configuration for your model. Your configuration should have been saved on the USB flash drive shipped with your controller. Contact your ProMinent distributor for more information.
Factory programming of sensor inputs is based on your specific purchase order. This may include controlling relays for pumps and solenoids. Some inputs require further setup. The factory does not setup analog flow or level inputs. However, this can easily be accomplished in the field if the range of the analog input is known. Refer to the calibration section 9.5 General Sensor Calibration

9.1 Analog and Digital Inputs

9.1.1 Enable an Analog or Digital Input:

This includes all analog and digital inputs except the serial (Conductivity) sensors. See section 9.1.2 Enabling a Serial Sensor

Sensor availability in the menus is dependent upon the installed driver cards. All sensors possible for each of the driver cards are made available at bootup. Sensor will probably need to be enabled after the driver card and sensor(s) are installed, and the controller is rebooted.

*Never remove or install a driver card with the power ON!*

---

**NOTICE**

For a faster and easier initial configuration, ProMinent recommends that general configuration of the controller, especially during commissioning, be performed using a portable computing device like a laptop, or a tablet computer. Keypad and smart phone interfaces are excellent for simple routine jobs of a few keystrokes like Clearing Alarms, Calibration or Setpoint changes. Refer to the DCM510 Browser manual for more information.

The keypad interface instructions in this manual are intended to show an operator how these individual tasks can be performed from the keypad. They are not intended to be all inclusive.

---

**WARNING!**

Sensor run-in period

This can result in hazardous incorrect metering

Take into consideration the sensor's run-in (polarization) period during commissioning:

- There has to be adequate feed chemical in the sample water for your application (e.g. 0.5 ppm chlorine)
- Accurate measuring and metering is only possible if the sensor is working correctly.
- It is imperative that you adhere to the sensor's run-in periods before calibration and control.
- Calculate the run in period when planning commissioning. It may take a whole day to run in some sensors.
- Refer to the sensor's operating instructions.

---

Press the MENU key.

1- Use the Up and Down ARROW keys to find and point to the **System** choice and press the **OK** button once.

2- The display will change to the System menu. Scroll up or down through the choices until the arrow points to **Enable I/O** then press **OK**

3- Using the arrow keys, scroll through the disabled I/Os until the you see the input you wish to enable

4- Press ENABLE [F3] key.

5- The input has been enabled and the display returns to the System menu to enable additional sensors if desired.

6- Press ESC (Escape) to exit
9.1.2 Enabling a Serial Sensor

Wire the sensor according to the color code on the controller terminations, Red, Black and Green.

For more wiring information:
If you are using input A or B, see section 6.3.7.1 Inputs on the Main Board.

1- Press Menu
2- Scroll up to System and press OK
3- Scroll down to Enable I/O and Press OK
4- Scroll down to the new sensor and press ENABLE or OK. Find your input A, or B
5- Scroll up to Compensation and press OK
6- Scroll down to the correct temp sensor and press OK
7- Press Escape.

Choose a unique name. Abbreviate as needed. Only a total of 16 Alphanumeric characters are allowed.

Example: Conductivity

This procedure is the same for all I/O points; Inputs and Outputs, digital and analog and includes 4-20mA points. When you name an input, you are changing the “descriptor”. This is how it is done:

1- Press MENU.
2- Scroll down to I/O Setup. Press OK.
3- Scroll down to the item you chose to name and press OK. If your relay/sensor is not listed, it is not enabled. See section 9.1 Analog and Digital Inputs for sensors and for relays, 10.2 Determine if a Relay is Enabled.
4- Press OK to edit the “descriptor” of the item.
5- Notice the F2 key represents the word ‘alpha’. You have three choices, ALPHA (upper case letters), alpha, (lower case letters), and NUMBERS, 0 through 9. Since the lower case ‘alpha’ is seen, please realize that this is a choice, not the current selection.
6- The default choice is upper case so use the up and down arrows to change the U in Unassigned to C for Conductivity or A for acid, etc.
7- Use the right arrow to move to the second position. Press the F2 key to choose alpha, for lower case letters. Notice that the F2 choice now shows NUMBERS. That would be the next choice.
8- Use the arrows to change the ‘n’ to ‘o’ and continue until your name is spelled.
9- When finished, press OK to save.

Use section 9.2 Changing a Descriptor to give the input a name.

9.2 Changing a Descriptor

Once you have enabled an input or an output, naming is helpful in avoiding programming mistakes.
9.3 Selecting an Analog Sensor Type

ProMinent amperometric sensors are compatible with the DCM5 via the isolated 4-20mA Input driver. Once the sensor type is selected, the controller will scale the input, provide calibration limits for the type selected, and clamp the measured sensor values so that an open loop does not measure a negative value. If your 4-20mA device is not on this list below, choose ‘other’ and enter the scale manually.

### 9.3.1 Selecting the sensor type:

The type cannot be changed once the sensor is linked with an output. If linked, use that output menu to uncouple the sensor from the relay/ output.

Refer to Table 12 4-20mA Sensors

1. Press **MENU**
2. Scroll up to **System**. Press **OK**
3. Scroll down to **Set Sensor Type**. Press **OK**
4. Scroll down to the 4-20mA input where the sensor is connected. Press **F3 SELECT or OK**
5. Scroll down until you see the type of sensor you have and press **OK**
6. Press **F1** to select the probe range.
7. Use the up/down arrows to change the range as needed. Press **F2 SELECT to save. Press ESC**
9.4 Analog Sensor Cleaning and Commissioning

9.4.1 General Remarks

Potentiometric sensors; pH, ORP, conductivity and corrosion rate.

Combination probes for the measurement of pH and redox-ORP potential consist of a measuring electrode – a glass electrode for pH, a platinum or gold electrode for redox measurement and a reference electrode, arranged concentrically around the measuring electrode.

**Amperometric Sensors:**

*See Table 12.*

These sensors are shipped with a complete sensor-specific manual. Refer to this manual for commissioning, cleaning and maintenance of the sensors. Refer to section 9.6 Calibrating an Amperometric Sensor

9.4.2 Sensor Commissioning

Before putting potentiometric sensors (pH and ORP) into operation, the protective cap or case must be removed from the glass or metal electrode. The electrode must be free from oil, grease and other contaminations. Likewise, the diaphragm of the reference electrode must be free from scale deposits, dirt or crystalized matter. **For these reasons, electrodes should never be touched by hand, nor allowed to dry out.** If contaminations are present refer to section 9.4.5. Cleaning and Servicing Probes.

9.4.3 Checking pH Probes

Connect the probe to the controller by means of the provided coaxial probe cable (taking care that connectors and cable remain absolutely dry), dip the probe into a pH 7.0 standardizing solution, or pool water with a known pH value, and adjust controller exactly to read this value.

Remove the probe, rinse it with water, preferably distilled water. Immerse the probe in a buffer solution differing by a least 2 pH from pH 7.0 (typically 10.0pH) -or- tap water with a known pH, typically ~8pH and compare the pH reading after the value on the display has stabilized. If within 30 seconds a steady-state value is not produced, clean probe as described in Section 6.2.4.2 and repeat calibration. If again unsuccessful, replace the probe.

9.4.4 Checking Redox/ORP Probes

With the probe connected to the controller by means of the probe cable (taking care that connectors and cable remain absolutely dry), dip the probe into a redox-ORP standard solution, e.g. of 465 mV.

The reading should reach this value +/- 30mV within not more than 30 seconds. If the reading rises rather sluggishly or falls short more than 30 mV, clean the probe as described in Section 6.2.4.2 and repeat check. If again unsuccessful, replace the probe with a new one, or adjust the ORP set-point accordingly.

**NOTE** A calibration of the controller or ORP input driver card will not normally be required, and is not allowed. This procedure serves as a probe check only.

9.4.5 Cleaning and Servicing Probes

All pH and ORP probes should regularly (once a month) undergo a visual check and be cleaned if necessary.
If deposits on the glass electrode withstand cleaning with a soft (child's) toothbrush the following cleaning agents may be used:

**CAUTION!**

Do not rub
This might cause damaging static electricity and false readings.

<table>
<thead>

Table 13  Glass electrode cleaning agents

It is essential that the probes are rinsed thoroughly after cleaning or using a buffer solution.

If the laterally arranged ceramic diaphragm of the reference electrode is blocked, it may be cleaned like the glass electrode. In addition it may be cleaned by cautious scraping with a finger nail, a razor blade or a fine file, but care must be taken that the diaphragm is not scratched.

**ORP sensors measure more than just chlorine.**

Because the ORP of water is a combination of all oxidants, reductants, the pH effect on those oxidants, and several other factors, ProMinent recommends testing the probe for movement and adjusting the set-points if necessary, to reach the desired oxidation control range.

9.4.5.1 Storage

From the factory, the pH and ORP (redox) combination probes are shipped with a cap filled with a 3-molar KCl solution.

In the field, the cap can be used to cover the probe tips for protection when not in use. If a KCl solution is not readily available, pool water or city drinking water are excellent replacements as they typically have a nearly neutral pH and a slight amount of sodium hypochlorite (bleach). Preferably, a pH of 4 to 7 and a slight amount of chlorine will keep the sensor from biological fouling during their storage.

Ensure by a visual check that the pH probes are free from entrapped air bubbles. If air bubbles are present, remove them by vigorously shaking the probe downward (like an old-school mercury fever thermometer).

Probes with KCl filling solution or gel should only be installed in open-ended in-line probe housings (max. 0.5 bar), type DGMa. Pressurized systems (usually non-aquatic applications) require special probes.

9.4.5.2 Service Life

Probes are subject to natural ageing even if handled correctly. Depending on the application, a service life of between 6 months and maximum of several years may be expected.

In individual cases, particularly when extreme service conditions are involved, their lifetime may be reduced to a matter of days.

*Subject to technical alterations.

9.5 General Sensor Calibration

9.5.1 Calibration Notes

Conductivity Temperature Compensation:
Conductivity sensors should always be temperature compensated. In the DCM510 the conductivity temperature compensation is usually accomplished by an internally integrated temperature sensor. If desired, a temperature sensor external to the conductivity sensor can be used. **Note:** If the temperature reading is off by more than 3°F, you may have a failed probe or wiring problem. After any temperature calibration, test the temperature sensor response with an ice bath.
Programming the Inputs

Analog sensors can be calibrated based on a single wet test (except ORP), or using a 2-point method. You can reset the input to factory default calibration as well. To perform the most common single point (offset) calibration:

1- Press the **CAL** button.

2- Use the Up and Down arrows to locate the sensor you wish to calibrate and press **OK**.

3a- **Single Point Calibration**: Notice the underline in the current value on the next screen. That is the cursor.

In this single point calibration screen, the up and down arrows will adjust this digit. The right and left arrows will move the cursor to a different decimal place to match your wet test. Pressing **F1** SAVE completes the single point calibration adjustment. Jump to step 3b for two point calibration.

Pressing **F3** MORE instead of **F1** SAVE gives you more calibration options.

3b- **2-Point Calibration**:

From the screen above, use the Up and Down arrows to select the sensor to be calibrated, then press **OK** to select.

This screen is for a single point calibration. To proceed to the 2-Point calibration sequence, press the **F3** MORE button.

Use the one of the arrow buttons to toggle to “2 Point Calib.”

Press **F1** SELECT to begin the 2 Point Calibration sequence.

4- Begin by placing the sensor into a known value sample (i.e. 7.00 pH buffer). Adjust the reading on the left of the screen until it is equal to the value of the wet test or buffer. Once the reading on the right is stable, press **F1** to continue to the NEXT step in the process.

The calibration program allows you to revert the calibration to factory defaults (Factory Reset) select a single point (default) or 2-point calibration method. Once chosen, the screen that follows step 2 above will be that choice. From this screen, you can select **F3** MORE, to switch to the other calibration mode or use the up arrow to select to Factory Reset calibration.
Remove the sensor from the first buffer, rinse with distilled or DO water, shaking or wiping off as much rinse water as possible, and place the sensor in the second buffer (10.00 pH) or known sample more than 2 pH units higher. Edit the value on the left as before. When the sensor is stable in the second solution, press F1 to Save and proceed to the NEXT screen and finish. -or- either F3 or ESC to CANCEL.

The controller may accept the value and show the Sensor Calibrated screen directly above.

If the value entered is too far from what the input signal is measuring, a fault message will be displayed. Then you will be given 3 choices on how to proceed.

Press F1 to RE_CALibrate the sensor [try again, maybe you forgot to put the sensor in the 2nd buffer?...].

Press F2 to IGNORE the fault and keep the current calibration even though it is not generally advisable. The controller will perform the math to make the display match your entry. The ability to track changes may be marginal or not possible if the sensor is faulty.

Press F3, RESET to cancel this calibration and return to the previously saved calibration.

**CAUTION!**

Correct sensor operation / Run-in period

Accurate measuring and metering is only possible if the sensor is working correctly.

Please read the specific operating manual for each sensor for more information.

The run-in (polarization) periods should be considered when planning commissioning.

It may take an entire 24 Hour day to run in a new CTE or CGE sensor.

**CAUTION!**

Proper sensor plumbing rules.

Prior to calibrating amperometric sensors, flow and pressure must be within acceptable parameters.

Take the time to familiarize yourself with section 6.2 Mechanical Installation, especially sections 6.2.4 Sensor Installation

**NOTICE**

The Oxidant ppm sensors do not have a 2-point calibration, as the technology has a fixed zero point.

1- Press the CAL key
2- Scroll down to the sensor you wish to calibrate. Press OK
3- Take a sample and press F1 DPD.

The controller remembers the sensor reading at the moment the F1 button is pressed and starts a convenient DPD test timer.

---

**9.6 Calibrating an Amperometric Sensor**

---

**Calibrations with pH Compensation**

It is important that you always calibrate the pH sensor before any pH compensated sensor, like free chlorine. Otherwise the compensated (chlorine) measurement will be shifted after the pH calibration.
4- Follow the DPD test manufacturer’s exact instructions. Press F1 DPD to start the clock. Use the “DPD wait:” timer on the screen if it is helpful (Especially for Total Chlorine DPD tests.)

 Calibration “DPD wait” Timer
Use this convenient clock if your test method calls for a specific waiting period before reading the sample value.

5- When the timer reaches the limit for your test, read the test value and enter it here using the arrows. Press F1 to SAVE the change.

6- Or use the MORE button to reset the input to the factory default calibration.

7- The controller should accept the value and show the Sensor Calibrated screen. Pressing F1 NEXT returns you to the CALIBRATE menu.

8- If the value you enter is not within the normal calibration tolerance, a sensor fault message will be displayed.

If there is a Sensor fault: That means the signal being measured on the sensor is not within normal limits and the sensor likely needs to be cleaned or replaced. You can either:

Press F1, RE-CAL to repeat the sensor calibration.

Or press F2 IGNORE to ignore the fault and keep the current calibration even though it is not generally advisable. The controller will then perform the math to make the display match your entry. The ability to track chemistry changes may be marginal or not possible if the sensor is faulty.

Or press F3, RESET to cancel this calibration attempt and return to the previously saved calibration.

9.7 Analog Sensor Alarms

(See flowchart on next page)

Analog inputs have high and low alarms to alert the operator if a measured value is out of the normal operating range.

9.7.1 Latching Alarms

Alarms in the DCM510 can be latching or non-latching alarms. Latching alarms are the default, but do not reset themselves if the parameter recovers back into the acceptable range. The operator must acknowledge the alarm for the alarm light and relay to reset if it is a relay alarm that has “Stop on Alarm = Yes”. If this is undesirable, select “non-latching = Yes” in the alarms section of the menu for each alarm.

Latching alarms are especially helpful for remote
installations where the operator checks on the system a few times a day or less. Under certain circumstances, like overnight, if there is a control or feed problem and the alarm does not latch, the operator would not know there is an issue until a complete failure of the feeder.

9.7.2 Delay on Alarm

The DCM510 also has an option to delay the alarm before alerting the operator. This feature is most helpful in applications where trapped air or other conditions cause the sensor reading to spike occasionally, but it is normal operation for that process. Without the delay, the controller would have frequent latching nuisance alarms, that would require acknowledgement by the operator. This option units are in minutes, and adjustable from the Alarms menu.

Alarm settings for all Inputs and outputs work in a similar way. There are 3 types of settings for the alarms on any input.

- Adjust Alarms changes the High and Low alarm limits.
- Clear Alarms, as implied will clear all alarms and reset the Delay on Alarm timer. Follow the steps below to alter the Alarm limit settings for any alarm.

9.7.3 Analog Alarm Configuration

1- Press MENU

2- Scroll down to Adjust Alarms and press OK

3- Scroll down until you locate your sensor and press OK

Note the underline in the high alarm value. This is the cursor.

You now have 2 choices; Edit the High and Low values, (F1 OTHER toggles between the Low and High alarm adjustment setting) F2 MORE takes you to the latching and alarm on/off page.

To adjust the High and Low values:

4- Use arrows to adjust the high alarm value as needed. Press F1 OTHER to switch to the low alarm. Note the underline cursor moves to the opposite value.

5- Use the arrows to adjust the low alarm and press OK to save.

6- To turn the alarm off or change the latching function: Press F2 MORE

7- Press F1 SWITCH to toggle between Latching to Non-Latching

8- Pressing F2 ALMOFF will toggle between enabling and disabling alarms for this input.

9- Press F3 BACK to return to the previous menu.

If you wish to see or edit the alarm delay, you must use the browser interface. Please see the Browser manual.
Programming the Inputs

9.8 Analog Sensor Diagnostics

Each sensor type has a diagnostic page to assist in determining sensor and driver card health.

1- Press MENU
2- Press the Status button (F1) or scroll up to I/O Status and press OK.
3- Use the arrows to find the I/O point you wish to evaluate and press OK.
4- Press F3 MORE, to see the first Diagnostic for this sensor.
5- Press the down arrow to scroll through the remaining Diagnostic screens.

List of typical sensor Diagnostics:

- Sensor Type, Raw Sensor input value, Gain Multiplier, Offset Adjustment, Last alarm, Current Status, Serial number and more.

A corrosion rate sensor has a pitting note and lists the metallurgy of the tips.

Driver cards have a list of other items that are used for factory tracking and troubleshooting.

9.8.1 pH-ORP Driver card Diagnostics

To see diagnostic press F1
Use Up/Down Arrow keys to navigate to desired pH-ORP input then press F3
- Diagnostic 1: sensor Type pH Sensor
- Diagnostic 2: Raw sensor value
- Diagnostic 3: Gain will change based on calibration
- Diagnostic 4: Offset will change based on calibration
- Diagnostic 5: reports any type of Alarm
- Diagnostic 6: Driver Type, Dual pH or ORP
- Diagnostic 7: Factory Use
- Diagnostic 8: Factory Use (Driver Type and Product Code)
- Diagnostic 9: Driver card Serial Number
- Diagnostic 10: Factory Use
- Diagnostic 11: Driver card Firmware version for example “01.00.02.00”

9.8.2 CT Conductivity Driver card Diagnostics

To see diagnostic press F1
Use Up/Down Arrow keys to navigate to desired Analog Conductivity input then press F3
- Diagnostic 1: sensor Type (Conductivity, Boiler Cond., Condensate)
- Diagnostic 2: Raw sensor value
- Diagnostic 3: Gain will change based on calibration Sensor Value = Raw x GAIN + OFFSET, for example 999 x 0.16+0=1599 µS
- Diagnostic 4: Offset will change based on calibration
- Diagnostic 5: reports any type of Alarm
- Diagnostic 6: Driver Type, Dual conductivity
- Diagnostic 7: Factory Use
- Diagnostic 8: Factory Use (Driver Type and Product Code)
- Diagnostic 9: Driver card Serial Number
- Diagnostic 10: Factory Use
- Diagnostic 11: Driver card Firmware version for example “01.00.00.02”
- Diagnostic 19: Temperature Input Value, for example 75F

9.8.3 The 4-20mA Input Driver Card Diagnostics

To see diagnostic press F1
Use Up/Down Arrow keys to navigate to desired 4-20mA Input I/O then press F3
- Status
- Diagnostic 1: sensor Type (CLE3 Chlorine, CBR Bromine, CGE Oxidant, CLO Chlorine, CTE Chlorine, Fluorescent, pH Sensor, ORP Sensor, Temperature, Toroidal Conductivity)
- Diagnostic 2: sensor Raw value, 11.99mA=66.6%, Amperometric sensors use 4-16mA for min and max range
- Diagnostic 3: Gain, changes based on calibration Sensor Value = Raw x GAIN + OFFSET, for example 11.99mA x 0.833+(-3.333)= 6.655ppm
- Diagnostic 4: Offset changes based on calibration, see step 5
- Diagnostic 5: reports any Alarm
- Diagnostic 6: Driver Type, for example Dual 4-20mA input
- Diagnostic 7: Factory Use
- Diagnostic 8: Factory Use
- Diagnostic 9: Driver card Serial Number
- Diagnostic 10: Factory Use
- Diagnostic 11: Driver card Firmware version for example "00.00.00.17"
- Diagnostic 14: Sensor Range for example 0-10ppm

9.8.4 The 4-20mA output Driver Card Diagnostics

To see diagnostic press **F1**
Use Up/Down Arrow keys to navigate to desired 4-20mA output I/O then press **F3**
- Diagnostic 1: sensor Type 4-20mA output
- Diagnostic 3: Gain will change based on calibration
- Diagnostic 4: Offset changes based on calibration
- Diagnostic 5: reports any type of Alarm
- Diagnostic 6: Driver Type, Dual 4-20mA Output
- Diagnostic 7: Factory Use
- Diagnostic 8: Factory Use (Driver Type and Product Code)
- Diagnostic 9: Driver card Serial Number
- Diagnostic 10: Factory Use
- Diagnostic 11: Driver card Firmware version for example "00.00.00.01"

9.8.5 Serial Sensors (CTFs, LPR, DP) Driver Card Diagnostics

To see diagnostic press **F1**
Use Up/Down Arrow keys to navigate to desired I/O then press **F3**
- Diagnostic 1: sensor Type (Conductivity, Corrosion, Differential Pressure)
- Diagnostic 2: sensor Raw value
- Diagnostic 3: Gain, changes based on calibration
- Diagnostic 4: Offset,
- Diagnostic 5: reports any Alarm
- Diagnostic 12: if sensor connected it will display (Sensor OK Connected) if no sensor connected to terminals (Sensor disabled Disconnected)
- Diagnostic 13: will display phantom input Temperature value and also if the Thermal flow switch is ON/OFF.
  In this example Flow value should be higher than 960 to display Flow ON.

Note: Sensor Value = Raw x GAIN + OFFSET.
  For example=235x8.5+0=1998uS about 2000uS

9.8.6 ORP/pH Temp mA Input card

The diagnostic information for this card is the same as 9.8.1 pH/ORP diagnostic and 9.8.3 The 4-20mA Input information.
9.9 Configuring Digital Inputs

9.9.1 Configure a Digital Input as a Water Meter or Status Input:

NOTE: All digital inputs O-V can be configured for a pulsing water meter or status (On/Off) input.

1- To Enable and Set digital input press **MENU**
2- Scroll to **System** and press **OK**
3- Scroll to Enable I/O and press **OK**
4- Scroll to select the desired input (O through V) and press **F3**
5- Press **F3** again to switch from **METER** to **CONTACT** if necessary, then press **OK**

A contact input is used to inform the controller of the status of a process. The probe header flow switch uses a status input. Any device that has two states can be used as a status input. The input provides +15VDC to ‘read’ a status input from a dry contact, Hall Effect or Reed switch. Avoid ‘Sine Wave’ or powered outputs.

Continue the flowmeter setup:

1- Press **MENU**
2- Scroll to **Water Meter Setup** then press **OK**
3- Scroll down to your meter, then press **OK**

Use **F3** to switch to Vol/Contact if necessary, then use Up/Down and

4- Left/Right arrow keys to set gallon per contact or to adjust the K factor, then press **F1** to **SAVE**.

**Note:** See 9.2 Naming an Input or Output to rename the relay for example to “Makeup Flow”
9.10 Disable an Analog or Digital Input

Inputs linked to outputs cannot be directly disabled. **Disable the output to sever the link, or choose a different analog sensor.** Use sections 9.10.1 and 9.10.2 to unlink the output, then return to this menu to disable the input.

1- Press **MENU**
2- Scroll down to **I/O Setup** and press **OK**
3- Scroll down until you locate your sensor analog or digital, and press **OK.** (This example shows an analog input)
4- Scroll down to **Configure** and press **OK**
5- If the sensor is not currently being used to control a relay, you can disable it. Scroll down to **Disable** and press **OK**.
6- If the sensor is in use by a relay, scroll down to **Used by I/O** to see which relay is using the sensor. Press **ESC** (Escape).

9.10.1 Changing or Unlinking an Analog Input Tied to an Output Relay

Inputs linked to outputs must be un-linked prior to being disabled. Analog inputs tied to Feed type relays, use pictogram **A**, or Backwash type use **B**.

A

1- Press **MENU**
2- Scroll down to Set Feed Mode. Press **OK**
3- Scroll down to the relay indicated in the ‘In Use’ menu (Step 6 in 9.11) and press **OK.**

Now you can choose a different sensor, or change the feed type. Either will release the sensor for deletion. See 4 and 5 below.

4- Use the up and down arrows to change the relay to a different type of control program, press **OK**.
5- Press OK, then scroll up or down to the new sensor and press **OK**
6- Press **F1**, ‘Select’ to save this choice.
7- Press **ESC**, Escape

Return to the 9.10 Disable an Analog or Digital Input menu, to finish.
1- Press MENU
2- Scroll down to Set Backwash Mode. Press OK
3- Scroll down to the relay indicated in the ‘In Use’ menu (Step 6 in 9.11) and press OK.

Now you can choose a different sensor, or change the feed type. Either will release the sensor for deletion. See 4 and 5 below.

4- Use the up and down arrows to change the relay to a different type of control program, press OK.
5- Press OK, then scroll up or down to the new sensor and press OK
6- Press F1, ‘Select’ to save this choice.
7- Press ESC, Escape

Return to the 9.10 Disable an Analog or Digital Input menu, to finish.

9.10.2 Changing or Unlinking an Analog Input Tied to a 4-20mA Output:

Inputs linked to outputs must be un-linked prior to the inputs being disabled. You can always unlink an output by deleting the output. Re-enable it if needed.

Relay outputs are designated by their number, 1 through 9. 4-20mA outputs can be letters C, D, E, F, I or J. This procedure can be used to change the input that the mA output represents, or you can choose ‘None’.

1- Press MENU
2- Scroll down to I/O Setup and press OK
3- Scroll down to the output letter and press F2, ‘NEXT’.
4- Use the up or down arrows to choose another input, or choose ‘None’ and press OK.
5- Press ESC (Escape).

If unlinking an analog input so as to disable it, return to the 9.11 Disable an Analog Input, to finish.
9.10.3 Changing or Unlinking a Digital Input Tied to a Digital Output

Inputs linked to outputs must be un-linked prior to the inputs being disabled. You can always unlink an output by deleting the output. Re-enable it if needed. See section 9.1 Analog and Digital Inputs.

If a digital input is used as an interlock for a relay, it must be unlinked prior to being disabled.

1- Press Menu
2- Scroll down to I/O Setup and Press OK
3- Scroll down to the relay or 4-20mA Output where the interlock is being used. Press OK.
4- Scroll down to Interlock and press OK
5- Press F1 (Remove) to unlink the digital input from this output.
6- Choose a new interlock or press OK to save the change. If more than one interlock, use the arrows to see them and remove as needed. Escape will void all changes.

See also 10.10 Interlocks

Return to 9.10 Disable an Analog or Digital Input to finish.

9.10.4 Changing or Unlinking a Digital Input Tied to a 4-20mA Output

If a digital input is used as an interlock for a relay, it must be unlinked prior to being disabled.

1- Press MENU
2- Scroll down to I/O Setup and Press OK
3- Scroll down to the 4-20mA Output where the interlock is being used. Press OK.
4- Press F2 Next two times to get to the Interlocks
5- Press F1 (Remove) to unlink the digital input from this output.
6- Choose a new interlock or press OK to save the change. If more than one interlock, use the arrows to see them and remove as needed. ESC, Escape will void all changes.

See also 10.10 Interlocks

Return to 9.10 to Disable an Analog or Digital Input.
9.11 Phantom Inputs

The DCM510 has a maximum of 10 analog inputs, A through J. Analog inputs are linked to the first 14 letter of the alphabet, A through N, which means 4 letters, K through N cannot be assigned to any wired input. They have no terminals. These are phantom or virtual analog inputs.

Digital Inputs are lettered from O to Z. Wired inputs are labeled from O to V. Input designators W, X, Y and Z can be used as phantom digital inputs.

In some cases it is advantageous to create a phantom sensor to duplicate an existing hardware sensor. Another use is to assign a phantom “virtual” input to show and data log a temperature sensor or flow switch that is an integral part of another sensor. We use the common CTFs sensor as an example to highlight how this is done. See 9.1.2 Enable a Serial Sensor

Any analog input, including Phantom’s, can be used as a manual input to data log operator test data. If you test the water each turn, you can log that value into this controller. It will be time stamped and is part of the complete historical database with all sensors, phantoms and relays.

Analog phantoms can be programmed to be used in control outputs in the same manner as any sensor input.

To create a phantom, enable an unused analog or digital input. Use the Configuration choice in the I/O Setup menu to edit the name, engineering units and decimal spaces. Use the Compensation menu to pick a phantom type; LSI, Inventory, Manual Entry, Calculate PPM or Combined Chlorine.

9.11.1 Create a Combined Chlorine Phantom

Since combined chlorine is the product of total Cl2 – Free Cl2, the controller must have one of each in order to calculate chloramines. If you do not see the choice for Combined Chlorine below, you may not have the correct probes. The Total Cl2 probe input must have either CTE or CGE as the type and the Free Cl2 probe input must be set for either CLE3 or CLO.

Enable an unused analog input. (Typically K). See section 9.1 Analog and Digital Inputs.

1- Press Menu
2- Scroll down to I/O Setup. Press OK
3- Scroll down to the input you chose to be the combined Cl2 phantom. Press OK
4- Scroll down to Compensation. Press OK
5- Scroll up to Comb. Chlorine. Press OK.
6- Scroll down to the total Cl2 sensor. Press OK.
7- Scroll down to the free Cl2 sensor. Press OK.
8- Press Escape.

The phantom input can now be used to trigger the UV Secondary setpoint. See section 10.21 UV Secondary
10 Programming the Control Outputs (Relay and 4-20mA)

This section will describe how to configure relays to control a process and 4-20mA outputs for control or as an indication of an analog input sensor. Outputs can be energized based on a sensor with ON/OFF set-points, a timed event, a combination of an event and a sensor, base feed, percent timer, a backwash routine and more options. These can include interlocking with digital inputs, blocks from other relays and a few special controls. Special Controls include timed cycling, time modulation and PID.

The part number and identification code on the order placed with ProMinent will determine the sensors and outputs that were configured as default at the factory. Some sensors may have been pre-wired, (pH and ORP coaxial cables, some conductivity and temperature sensors, ppm residual sensors). Other sensors like water meters and chemical feeders may have been configured, but will have to be field installed, wired, enabled and possibly re-configured during commissioning.

Note 1: Relays can be enabled as one of three types; Feed, Backwash or Events-Other. Once a relay is enabled, the only way to change the assignment from one of these types is to disable the relay and enable it as a different usage.

Note 2: When an output is disabled and then re-enabled, the control is reset and all user control settings removed. This action puts the relay control into a defined state prior to reconfiguring.

A sensor input can be used as an analyzer or monitor, but to be able to control a feeder or a valve, it needs to be linked to an output. Linking is achieved in the configuration process. See Section 10.6 Configuring a Feed Relay.

10.1 Frequency/Pulse Outputs:

Frequency controlled Pumps feed chemicals at varying rates (Frequency controlled pumps are outputs 6 to 9) Any analog sensor: temperature, flow, corrosion rate, ORP… may be used to frequency control a pulse controlled pump. The output is proportional to the input sensor using part or all of the sensor range.

Example: Using a pH sensor with an input of 0 to 14pH, you could set 0 pulses at 0pH and maximum pulses at 14pH. The higher the pH, the faster the output pulses. Or you could set the output as a range of 0 pulses at 7.2pH and maximum pulses at 7.8pH. This shortened range would cause the pump to speed up and down more rapidly with changes in pH. In this manner, pump speed control is achieved without using a 4-20mA pump.

Alarm settings for Volume @Max SPM (Strokes per Minute) and Volume/Day are limited to 500 Gallons. These alarms are adjustable in the output alarm menu. The alarm for volume @ maximum strokes per minute was created for the situation where a pump is at full speed for too long a period of time. For example, an acid pump that cannot lower the pH enough to slow the pump from the maximum speed after say 10 minutes, might be considered an alarm condition. Waiting until the pump feeds more than the volume per day would be much too long. If you calculate the pump is feeding, for example, 24 GPD at 100% speed, you know that setting the Volume @ max stroke will alarm in one hour if set for 1 gallon. (24GPD / 24 hours = 1 GPH). So if you want the pump to alarm after 10 minutes, enter 1/6th of a gallon, or 0.1667G and if the pump runs at 100% for 10 minutes, it will have pumped 01.667 gallons and trip the alarm.

The Four OptoMOS DOs (Digital/Frequency Outputs) P6,P7,P8, & P9 can each be set to either:

1- Pulse output/Frequency
2- ON/OFF

Note: this setup is done during the enabling of the output.

In the ON/OFF mode, the output behaves the same as the powered relays, 1 through 5. Programming is the same in most cases. Output relays, once configured, must be disabled and re-enabled if you need to change their type. See section 10.3 Enable and Configure a Relay.

10.2 Determine if a Relay is Enabled:

1- From the Home display, press the F1 STATUS key.
2- Scroll through the enabled I/O. If you do not see your relay, it is disabled.
10.3 Enable a Relay Type

1- Press the MENU key
2- Use the ARROW keys to scroll to System then press OK.
3- Scroll up to Enable I/O then press OK
4- Scroll through the disabled I/Os until you see your relay.
5- Once the output is selected, press F3 ENABLE key.
   To complete the enable process, you must choose a relay type.

This menu shows the default type of output as “ON/OFF” and the control as “Events-Other”. ON/OFF is the only choice for the first 5 relays. Relays 6 – 9 can be either ON/OFF or frequency type.

Step 6 is divided into two methods; the first for relays 1 – 5 and the second for pulse relays 6 – 9.

6a- For AC-Powered Relays 1 – 5 programming:
Choose which type of relay program you wish to use, F1 for Feed, F2 for Backwash or press OK to keep the Event-Other choice. Follow F1 or F2 with an OK to select the control

6b- For DC (Pulse) Relays 6 - 9 programming:
Use a pulse frequency output to control the speed of the pump. If you desire an ON/OFF output, press F3. To choose a control type different from an Event, use F1 or F2.

At this time, we recommend naming the relay to avoid confusion during programming. Once named, we will set up the remaining relay attributes.

10.4 Naming the Output

In section 10.3, we showed how to enable a relay. Regardless of the type of relay you choose, the next step is to name it.
Pick a name that identifies the relay for you or your customer; Hypochlorite, Acid, CO2, etc.

1- Press MENU.
2- Scroll down to I/O Setup. Press OK.
3- Scroll down to the relay you chose to name and press OK. If your relay is not listed, it is not enabled.
4- See 10.2, Determine if a Relay is Enabled.
5- Press OK to edit the description of the relay.
6- Use the right arrow to move to the second position. Press the F2 key to choose alpha, lower case letters. Notice that the F2 choice now shows NUMBERS. That would be the next choice.
7- Use the arrows to change the next letter/space and continue until your word is spelled.
8- When finished, press OK to save.

Please notice that the F2 key represents the word ‘alpha’.

You have three choices, ALPHA (upper case letters), alpha, (lower case letters), and NUMBERS, 0 through 9. Since the lower case ‘alpha’ is seen, please realize that this is a choice, not the current selection.

This naming/Descriptor procedure is the same for all I/O points; Inputs and Outputs, digital and analog and that also includes 4-20mA ports.
10.5 Relay Configuration

Bkwash will set up the output for a backwash based on the following options; Manual, based on a dry contact input, Timed Event, Pressure Switch, or a Pressure Sensor. See 10.7 Configuring a Backwash Relay.

The Feed option prepares the output for a chemical pump based on sensor setpoints or water meter volume. See 10.6 Configuring a Feed Relay.

Additionally, a feed output has three special control types; Timed Cycling, Time Modulation, and PID.

Event-Other is used to configure a timed event relay. Timed events are used to deliver chemicals periodically. When selected, an Events choice is added to the main relay menu. Other refers to Heater Stop, Alarm, Sensor Wash, Recirc Pump, UV Stop, UV Secondary and SCADA Notify. See 10.9 Configuring an Event-Other Relay.

Each of these relay types have special control functions available.

10.6 Configuring a Feed Relay

If you have not enabled the relay, see section 10.2 Determine if the Relay is Enabled and/or 10.3 Enable and configure a Relay. If you have not named the relay, See section 10.4 Naming the Output.

There are four types of Feed Relay choices:

- Feed based on any analog sensor including any 4-20mA input,
- Using a percent timer
- Heater Stop
- Feed based on a water meter

Sections 10.6.1 through 10.6.3 show how to set up these types of feed. Meter control is not shown.

10.6.1 Feed Based on a Sensor

A sensor based relay will energize a pump or valve depending on the ON and OFF set-points.

Prior to these program steps, you need to enable an analog sensor input. See 9.1.1 Enabling an Analog Input and 10.3 Enable and Configure a Relay.

1- Press MENU.
2- Scroll down to Set Feed Mode and press OK.
3- Scroll down to the relay you wish to use and press OK.
4- Scroll down to Sensor Control and press OK.
5- Scroll down to the sensor you wish to use and press F1, Select.
6- Use the arrows to edit the On set-point. Press F1, OTHER to toggle between the On and Deadband values.
7- Press OK to save.
10.6.2 Percent Time & Base Feed

This method applies to the first 5 relays and the pulse relays R6 through R9 when programmed for ON/OFF mode.

Pulse outputs, R6 – R9, use a proportional range to control the speed of the pulses to the pump.

The Percent Time program is based on a 5 minute time frame. The controller calculates the percent of 300 seconds and will turn on the feed relay for that calculated time. Each 5 minutes, the calculated time is again applied to the feed relay.

If you have not enabled the Feed relay, see section 10.6 Configuring a Feed Relay.

1- Press MENU
2- Scroll down to Set Feed Mode and press OK.
3- Scroll down to your feed relay and press OK.
4- Scroll down to Percent Time and press OK.
5- Use the arrows to edit the percentage and press OK to save and exit.

A pulse relay (R6 – R9) in frequency mode also has a base feed option. Choose Base Feed and enter the milliliters per minute rate. This pump will then feed constantly at that rate.

10.6.3 Heater Stop (Future option)

This method applies to all relays including R6 through R9 when they are selected as On/Off outputs.

10.7 Configuring a Backwash Relay (Future Option)

A backwash relay will send a powered or dry contact signal to your backwash controller based on a differential pressure switch, a pressure sensor (analog), by manually selecting 'Start' or a timed event. If you are using a switch or sensor, you will need to enable and configure them.

For inputs from pressure sensors or switches, enable and configure them. See section 9.1 Analog and Digital Inputs

For the relay, See section 10.4 Naming the Output. If you have not enabled the relay, see section 10.2 Determine if a Relay is Enabled.

Set up the Backwash relay by first choosing how it will be initialized. Manually, by a timed event, based on a differential pressure switch or based on a differential pressure sensor (analog) with a setpoint.

1- Press Menu
2- Scroll down to Set Backwash Mode and press OK
3- Scroll down as needed to select the start type. The next section will discuss the four options.
10.8 Manual Backwash (Future Option)
Press F1 to start a backwash cycle

Choosing a cycle;
1- Press Menu
2- Scroll down to Events and press OK
3- Scroll down your relay. Press OK
4- You should have 0 Events and Weekly is the default cycle. If you wish to change the cycle, press F3 Config. Use the right and left arrows to select another cycle. Press F1

10.9 Configuring an Event-Other Relay

10.9.1 Schedules
Events are used to energize a relay for a set amount of time repeating at a particular time and date. Any relay can be set up for event feeding. Choose from three cycle types; 24 hour, 7 day or 28 day. Events will repeat every day, week or every 4 weeks. See 10.9.2.1 Adding Events

If you have not enabled the Feed relay, see section 10.6 Configuring a Feed Relay

Events can be applied to any relay 1 through 9. Pulse relays R6 through R9 will program and react the same as the powered relays R1 through R5 unless you set the pulse relays for frequency. The difference is the On/Off relays will turn on for a set amount of time, and the pulse relays in frequency mode will turn on for a set amount of milliliters of feed. Typical Aquatic applications do not use frequency pumps so only On/Off mode is discussed here.

To set up an event schedule on a relay, you will need to choose a cycle. The cycle choice will depend on the frequency of the events. If you want the output energized more than once per hour, choose the daily cycle. If your events happen multiple times a week, choose Weekly. If less frequently, choose the 28 day cycle.
You can only choose one cycle per relay with a maximum of 28 events in the cycle.
10.9.2 Add, Remove, Edit Events

10.9.2.1 Adding Events

Once a relay is enabled as an Event output, and the cycle has been chosen, you can add events. Press the Menu key and scroll down to Events and press OK. Scroll down to your relay and press OK again. Press F1 Add. Depending on the cycle chosen, you will see slightly different screens.

The three cycle types are shown below. This chart works for all relays 1 through 9.

The Add screen presents a default day, start time and pump ON time. Use the arrows to edit these values and press F1 to save the changes.

1- Use the left/right arrows to choose a frequency. ONCE will enter only the event you just created. It will repeat each cycle. The other choices differ for each cycle type. They can save time adding similar events. Press F1 Select to save the choice.

3. The event has been created. Press F1, Add to create another event, F2, Adjust to make changes to the current events or F3, Config to make changes to the cycle type.

Finish the programming. Use 10.4 Naming the Output, 10.10 Interlocks and, 10.11 Blocks, or 10.7.2 Remove or Edit an Event.
10.9.2.2 Remove or Edit Events

If you have event(s) you wish to remove or edit, follow these steps;

1- Press Menu and scroll down to Events. Press OK.
2- Scroll down to your relay and press OK
3- Use the up and down arrows to find an event you wish to edit or delete.
4- Press F2, Adjust to edit or delete an event or F3, Config to re-configure the relay. See 10.9 Configuring an Event-Other Relay
5- If you pressed Adjust, use the arrows to make changes to the start time and length. Press F1 to save and exit or F2 to delete.

This process works for all relays.

10.10 Interlocks

Interlocks are digital inputs that temporarily pause an output from operating (Relays 1 to 9 and 4-20mA outputs).

For example, a digital (dry contact) signal from a backwash system can be brought into the controller and used as an interlock to pause a UV and/or a heater.

10.10.1 Setting/Removing Interlocks

1- From the MENU page, scroll down to I/O Setup and press OK
2- Scroll down to the relay you wish to edit and press OK
3- Scroll down to ‘Interlock’ and press OK
4- Scroll up and down to see all available interlocks (digital inputs configured as Contact Set) Press F1 to select.
5- The block symbol indicates that this input is currently selected.

From this screen, you can choose multiple interlocks or remove them. The F1 key will toggle between selection and removal.

Display choices

The Boolean OR and AND choices described below are selectable with the F2 key. Please remember that the text associated with the F2 key is a choice if you press the key, not the current use. Thus, if you see OR, you are in the AND mode. At this point, if you choose OR by pressing the F2 key, you will then be in the OR mode. Now the F2 key shows a new choice, AND. The F2 key will toggle between these two choices.

Notice the F2 key says ‘OR’. This means if you press F2, you will choose a Boolean OR for the interlocks. Thus, if any one of the interlocks are ‘ON’, (shorted) the relay will be enabled. If you do not press F2, the Boolean AND will rule the interlocks.

AND means all interlocks chosen must be ON to enable the relay. Multiple Interlocks are not typical.

Any one interlock can be used on multiple relays and 4-20mA outputs.
10.11 Blocks

Blocks are used to ensure that two or more relays (Relays 1 to 9) are not on together should their chemistry be incompatible. 4-20mA outputs cannot be blocked but have interlock capability.

Setting blocks – all relays 1 to 9.

1- Press the MENU key
2- Use the ARROW keys to select I/O Setup, then press OK
3- Use the ARROW keys to select a relay that will be turned off by another relay, then press OK
4- Use the ARROW keys to select ‘Blocked by’ then press OK
5- Choose an output with ARROW keys and press SELECT [F1]. A solid square □ will appear to the left of any and all output(s) selected. Press F1 REMOVE to deselect an output. Once the blocking output selections are correct, press OK to save your selections.

You could have up to 8 relays blocking any 1. Do not block in both directions! (R1 blocked by R2 and R2 blocked by R1).

10.12 Control Action (ON Decreases/ON Increases Sensor):

Note: Used for R1-R5, and P6-P9 in the ON/OFF mode.

Control Action tells the controller what direction to expect the sensor value to take if the relay is turned on. Since Acid will drive a pH downward, this would be set for ‘ON Decreases’. Most chemicals drive the sensor upwards. That would be an ‘ON Increases’ setting.

The Control Action choice allows the output control to be inverted. If you need to switch from acid to caustic on a pH control application you can reverse control using these steps.

1- Press MENU
2- Scroll to the I/O Setup selection and press OK
3- Scroll to select the relay desired and press OK
4- Scroll to Control Action and press OK

Screen shows “ON decreases sensor” which is normal for blowdown function as the conductivity should decrease when the blowdown valve is open.

5- To invert the output to “ON increases sensor” press the SWITCH [F1] key, then press OK.

Since the basic control has changed, the display changes to the relay Adjust Set-points screen to allow you to edit the new set-points. You will notice that the On: and Off: values have been reversed.

6- Use the ARROW and OTHER keys to change the limit points if needed, then press OK to accept and use these values.

Be sure to change the relay description to fit the new chemical treatment.
10.13 Special Control Functions:

Special controls are additional types of control that improve on simple ON/OFF control. The three general control types have the following special controls:

Feed: Time Cycling, Time Modulate, and Proportional, Integral and Derivative (PID) control and Heater Stop. (Heater Stop is a future option)

Backwash: None

Events-Other: Alarm output, Sensor wash, Recirculation Pump, UV Stop, UV Secondary and SCADA Notify

10.13.1 Timed Cycling:

Note: Special Control for Feed type relay. These instructions work with relays 1 – 5. These instructions work with relays 6 – 9 when they are in ON/OFF mode.

Often there is a long time delay between adding a chemical and measuring its effect at a sensor. This causes set-point overshoot and poor control.

Timed Cycling feeds for a user defined ON Time then waits for a user defined OFF time (OFF time = Period – ON time) before feeding again, allowing the system to respond to the fed chemical. During the ON Time, ON-OFF pumps and frequency controlled pumps feed on set-point control. Setpoints are edited from the Adjust Setpoint menu.

The On Time and Period are adjustable. The Off Time is the difference between the two. If the Period is 50 seconds and the On Time is 10 seconds, the Off Time will be 40 seconds.

The relay Diagnostic display counts down the time in the ON Time and OFF Period.

Selecting a Special Control automatically sets typical default times or sensor values.

Adjust the default values for your site’s application.

1. To Set and adjust the Timed Cycling press MENU
2. Scroll to the I/O Setup selection and press OK
3. Scroll to select the desired relay (2:Chlorine Pump) and press OK
4. Scroll to Special Control and press OK
5. Scroll to Timed Cycling and press F1
6. Use Up/Down and Left/Right Arrow keys to Edit the Period value then press F2. In this example the default 900 second Period.
7. Use Up/Down and Left/Right Arrow keys to Edit the ON Time then press F2. In this example the default is 120 second ON Time.
8. Relay 2 is now ON for 120 seconds and OFF for 780 seconds in each 900 second Period.
9. Press ESC Escape to save and exit.

10.13.2 Time Modulate

Note1: Time Modulate is a Special Controls selection for Feed type relays

Note2: Relays P6-P9 must be set to ON/OFF Mode

Time modulate has adjustable turn on and turn off set-points, a period and a direction, increasing or Decreasing the variable. Example of Increasing: A chlorine pump will increase the ORP reading.
Example of Decreasing: Acid will decrease the pH.

When using Time Modulate on an increasing control loop, the Turn On set-point will be lower than the Turn Off set-point. When the ORP is below the Turn On set-point, the output relay is on constantly. When ORP is above the Turn Off set-point, the output relay is off constantly. In either case, Time Modulate is not operating until the ORP is between the set-points. It is on in proportion to the ORP value with respect to the range between the set-points.

Setpoints are edited from the Adjust Setpoint menu.

**Example:** Period = 100 seconds, ORP Turn ON set-point = 400mV and ORP Turn OFF set-point = 500mV, current ORP = 450mV. 450mV is halfway between setpoints of 400 and 500 so the pump will be on for 50% of the period time or in this example 100 sec x 50% = 50 seconds on and off for 50% or 50 seconds.

If the ORP drops to 430, the pump will be on for 70% and off for 30% of the 100 second period.

**Time Modulate** works for both increasing and decreasing control loops.

1. To Setup and/or adjust the Time Modulate feature, press MENU
2. Scroll to the I/O Setup selection and press OK
3. Scroll to select the desired relay and press OK
4. Scroll to Special Control and press OK
5. Scroll to Time Modulate and press F1
6. Use Up/Down and Left/Right Arrow keys to Edit the Period value then press F2. In this example the default Period is set to **120 second**
7. Use ESC key to Exit

This method works on relays 1 – 5 and with 6 – 9 when they are in the ON/OFF mode.

---

**SPECIAL CONTROL TIP:**

When using Timed Cycling, Time Modulate or

---

**Table of Contents**

No table of contents entries found.

---

**Note:** Relays P6-P9 must be set to Pulse Mode

---

**10.13.3 PID Control**

---

Each of the P6 to P9 Outputs can be configured for PID (Proportional-Integral-Difference) control. PID control can also be used on 4-20mA outputs.

We highly recommend Timed Cycling or Time Modulate for control over PID because these methods are highly functional and simple to set up/understand. In most water treating applications, a full PID setup does not noticeably increase the control regulation of the process but is difficult to set up/tune. However, using only the proportional setting of the PID setup and leaving the others settings at default is easy and effective.

Relays configured for PID control are continuously modifying the pump relay ON & OFF times.

1. To set and adjust the PID settings, press MENU
2. Scroll to the I/O Setup selection and press OK
3. Scroll to select the desired output (6: Chlorine Pump) and press OK
4. Scroll to Special Control and press OK
5. Scroll to PID Control and press F1
6. Use Up/Down and Left/Right Arrow keys to Edit xP Proportional value then press F2
7. Use Up/Down and Left/Right Arrow keys to Edit Integral Rate value then press F2
8. Use Up/Down and Left/Right Arrow keys to Edit Difference Rate value then press F2
9. Use Up/Down and Left/Right Arrow keys to Edit Relay Period value (if P6-P9 is set to pulse output skip this step) then press F2
10. Use ESC key to Exit
10.14 Math Functions

Mathematical expressions can be used for control when programming relays and 4-20mA outputs. Phantom inputs can be used in the expression as adjustable variables.

The expressions are entered into any relay Feed Mode equation.

10.14.1.1 Digital Inputs

Digital inputs that are used as either contacting head or turbine watermeters can be added together. No other math function is allowed. No other digital input type can be included in the mathematical equation.

The total value of all meters in the expression will be compared to the relay’s setpoint to determine when the relay will actuate.

Select Set Feed Mode from the menu. Select the relay you wish to use. Choose feed mode as Watermeter. Scroll up or down to “Edit control eq’n”. Enter the letters of the meters adding + signs (Operators) between each letter (Operand). These expressions may have up to 4 operands and 3 operators.

Examples: O+T, O+P+Q+R

10.14.1.2 Analog Inputs

Relays and 4-20mA outputs controlled by analog sensors can be further controlled using some mathematical functions; Addition, Subtraction, Multiplication and Division.

These expressions may have up to 4 operands and 3 operators.

Example: A+B*C+D.

The expression is calculated from left to right as no parenthesis () are allowed.

Example:

If the values of the operands are as follows...

A = 2   B = 3   C = 4   D = 5

...the following expressions will be calculated as shown:

A+B/C = 1.25
B/C+A = 2.75
A/B+C = 4.666

Table 14  PID parameters
10.15 Relay Outputs 1 through 9
To set up a relay, use the steps in section 10.6.1 Feed Based on a Sensor. When you reach the step for selecting the controlling sensor, scroll down to “Edit control eq’n”.

Press Ok. Use the up and down arrows to find the letter of the first sensor (Operand) then move to the right one space using the right arrow. Now use the up and down arrows to select the mathematical function you wish to use. (Operator) Addition (+), multiplication (*), subtraction (-) or division (/). Move to the right again and select the second operand letter and so forth. See section 10.11.4.2 Analog Inputs for mathematical expression rules.

For relays 1 to 5 and the frequency relays 6 to 9 in the on/off mode, the output will be on based on the relay setpoints and the mathematical expression.

Frequency output relays 6 through 9 in the pulse mode will speed up or down proportionally between the on/off setpoints.

For example, if the selected analog inputs have values of 5 and 7, and you are using the multiplication function, the relay will operate based on the product, 35.

If you are using a frequency output in the pulse mode, and the ON setpoint is 40 and the OFF setpoint is 30, the speed of the pulses will be at 50% since 35 is half way between the ON and OFF setpoints. If the ON setpoint is 100 and the OFF setpoint 0, the output will be at 35% speed.

Notice that the analog choices include phantoms. Phantoms allow a user, either local or remote, to change its value.

10.16 Analog Outputs (4-20mA)
Analog outputs can use math functions as well as relay outputs, however the setup is not as simple as for relays. A frequency output relay must be utilized as a go-between.

Select an unused frequency relay and program it for pulse type output. Select the ON/OFF setpoints as above in section 10.11.4.1 Relay Outputs. As before for relays, up to four analog operands can be selected including phantoms. Once the frequency relay is programmed, program the 4-20mA output for control by that frequency relay.

The mA output will be proportional to the ON and OFF setpoints in the frequency relay.

Example: If the on and off setpoints are 0 and 100, and the product of your math function is 75, the output will be 75% or 16mA.

10.17 How to Setup a Relay as an Alarm Output:
An Alarm relay will change states whenever the controller post an alarm condition on the alarm page.

This method applies to all 9 outputs, however, when enabling a pulse output, relays 6 – 9, choose the ON/OFF setting. See section 9.2 Enable and Configure a Relay.

Note: R1-R5 relays are Form C (SPDT) and if using NC contact for Alarm, NC contact is not held closed so losing power won’t open the contact.

R6-R9 relays are optoMOS. They can be used with 24VDC/250mA power. They must be in the ON/OFF mode.

1- To Set a Relay to an Alarm press MENU
2- Use Up/Down Arrows to navigate to I/O Setup
3- Scroll to select the desired relay (for example 5:unused) and press OK, if there is no selection (Empty list) it means you haven’t set any relays as an Event-Other
4- Use Up/Down Arrow keys to select Special Control then Press OK
5- Use Up/Down Arrow keys to Scroll to Alarm Output Press F1
6- Use ESC key to Exit

Note: See 9.2 Naming an Input or Output to rename the relay for example to General Alarm

10.18 Sensor Wash:
Future Item
A special control function that allows pH and ORP sensors in the probe header to be washed in-line with acid based solution on a timer. R6-R9 must be in ON/OFF mode.
The relay will halt acid and oxidant outputs for a predetermined time to allow the sensors to recover from the acid wash.
10.19 Recirculating Pump:
Possible Future Item

10.20 UV Stop:
Future Item
Applies to relays 6 through 9 in ON/OFF mode. Use this to pause a UV during a backwash cycle.

10.21 UV Secondary:
Use combined chlorine to raise the power setpoint of a UV, increasing the destruction of chloramines.
Requires a free and a total chlorine probe. Use these probes to create a phantom sensor, combined chlorine. See section 9.1.1 Phantom Inputs.
Requires a frequency output relay, R6 through R9 set for ON/OFF mode. See section 9.2 Enable and Configure a Relay.
1- Press Menu
2- Scroll down to Setup I/O. Press OK
3- Scroll down to an unused frequency relay, 6 through 9. Press OK.
4- Scroll down to Special Control. Press OK.
5- Scroll down to UV Secondary. Press F1 Select.
6- Scroll down to the phantom input you created above. Press F1 Select.
7- Press Menu.
8- Scroll down to Adjust Setpoints. Enter the PPM level of chloramines that you wish to use as a setpoint. Typically, 0.4PPM with a Deadband of 0.0.

10.22 SCADA Notify:
Future Item.

10.23 Prime (Force On/OFF) a Relay
All relays can be forced on temporarily if not disabled, blocked or interlocked. If disabled, see 10.3 Enable and Configure a Relay. If blocked, see 10.11 Blocks. If Interlocked, see 10.10 Interlocks.
To force any relay on, press Menu.
Scroll down to Prime, Force ON and press OK.
Scroll down to the relay of your choice and press OK.
The timer defaults to 5 minutes. Use the arrows to adjust as needed. The underline is the cursor.
Press F3 Start
If you wish to stop the relay prior to the timer ending, press F3 Cancel.
Conversely, if the relay is on by any means, you can stop it temporarily using F1.
10.24 Auto Fill

Set a relay to fill a pool based on a digital input from a float switch.
Enable a digital input (O through V) as a ‘contact set’.
Use the menu to change the description to ‘Float Switch’ or similar.
Enable a relay and set for Feed mode.
Use the menu to Set Feed Mode for ‘Sensor Control’.
Select the digital input letter you enabled above.
The Deadtime is how long the relay stays on after the input has turned off. Adjust and press OK.
Adjust setpoint menu will allow you to adjust the Deadtime value anytime.

10.25 4-20mA outputs:

4-20mA Outputs display the description, the loop current with it’s corresponding percentage and the Control By sensor when in Auto.

Manual Mode:
Use Manual mode to verify the 100% ON=20mA, OFF=4mA or modulate operation of the proportional pump or valve that the 4-20mA output is controlling.
Use Auto mode to verify that an input is proportionally represented at the output.

Load Powered 4-20mA Loop:
4-20mA current outputs are isolated and loop powered (24VDC). No need to add power to the loop.

Open Loop Alarm:
The DC isolated 4-20mA output alarms on an open loop, this function can be turned ON/OFF.

Calculating Loop Current:
4-20mA Output current = 4 + (16 x (Actual Sensor Value - 4mA sensor value ))/( Sensor 20mA value - Sensor 4mA value)

For example:
A pH sensor is reading 7.0pH. To calculate the 4-20mA output when the scale is 0 to 14;
4 + (16 x (7.0 - 0))/(14 - 0) = N
4 + (112/14) = N
4 + 8 = N = 16mA

The output card can be configured to drop to 4mA when the stop button is pressed on the keypad (when using to control a pump or solenoid) or to continue if used to send sensor value to DCS.

10.25.1 How to assign 4-20mA output to control decrease (e.g Acid Feed):
1- To Set 4-20mA output to control decrease press MENU
2- Use Up/Down Arrows to navigate to I/O Setup
3- Scroll to select the desired output (for example E:4-20mA output) and press OK and then press F2
4- Use Up/Down Arrow keys to select desired input (here we selected pH input) then press F1
5- The next menu will ask for interlock if any needed. If no need, scroll to none then Press F1 (you could interlock it with any digital input for example flow switch or a phantom DI)
6- Set the high pH value then press F1 (in this example if pH sensor is reading 7.7pH the 4-20mA will be 20mA and the acid pump will be feeding at max speed)
7- Set the low pH value, then press F1 (in this example if pH sensor is reading 7.20 pH, the 4-20mA will be 4.0mA and the acid pump should stop feeding).
8- In this example between pH 7.20=4.0mA and 7.70=20mA the 4-20mA output will be proportional
9- Press ESC Escape to finish or press F1 to continue with output setup. You can choose to turn the open loop alarm on or off, then choose to set the output to drop to 0% (4mA) or remain as is when the keypad STOP button is pressed. This allows you to shut down the output to a pump, or continue to send a value to a DCS.
10.25.2 How to assign 4-20mA output to control increase (e.g. Caustic Feed):

1- To Set 4-20mA output to control increase press MENU
2- Use Up/Down Arrows to navigate to I/O Setup
3- Scroll to select the desired output (for example E:4-20mA output) and press OK and then press F2
4- Use Up/Down Arrow keys to select desired input (here we selected pH input) then press F1

5- The next menu will ask for interlock if any needed if no need scroll to none then Press F1 (you could interlock it with any digital input for example flow switch or phantom DI)
6- Set the low pH value then press F1 (in this example if pH sensor is reading 7.00 pH the 4-20mA will be 20mA and the Caustic pump will be feeding at max speed)
7- Set the high pH value then press F1 (in this
example if the pH sensor is reading 7.50pH, the output will be 4.0mA and the pump should stop
8- In this example between pH 7.00=20mA and 7.50=4.0mA the 4-20mA output will be proportional
9- Press Escape to finish or press F1 to continue with output setup. You can choose to turn the open loop alarm on or off, then choose to set the output to drop to 0% (4mA) or remain as is when the keypad Stop button is pressed. This allows you to shut down the output to a pump, or continue to send a value to a DCS.

10.25.3 How to assign 4-20mA output to measured value (application: feedback to PLC/DCS):
1- To Set 4-20mA output to measured value press MENU
2- Use Up/Down Arrows to navigate to I/O Setup
3- Scroll to select the desired output (for example E:4-20mA output) and press OK and then press F2
4- Use Up/Down Arrow keys to select desired input (here we selected pH input) then press F1
5- The next menu will ask for interlock if any needed if no need scroll to none then Press F1 (you could interlock it with any digital input for example flow switch or phantom DI)
6- Set the High pH value then press F1 (in this example if pH sensor is reading 14.00 pH the 4-20mA will be 20mA)
7- Set the Low pH value then press F1 (in this example if pH sensor is reading 0.00 pH the 4-20mA will be 4.0mA)
8- In this example between pH 14.00=20mA and 0.00=4.0mA the 4-20mA output will be proportional.
9- Note: The customer must use the same scale. If their scale is different, one side must change to equal the other.
10- Press Escape to finish or press F1 to continue with output setup. You can choose to turn the open loop alarm on or off, then choose to set the output to drop to 0% (4mA) or remain as is when the keypad Stop button is pressed. This allows you to shut down the output to a pump, or continue to send a value to a DCS.

10.25.4 How to set 4-20mA output to Manual Mode:
1- To Set 4-20mA output to Manual press MENU
2- Use Up/Down Arrows to navigate to I/O Setup
3- Scroll to select the desire 4-20mA output (for example E:4-20mA output) and press OK and then press F3 to set it to Manual
4- Use Up/Down and Right/Left Arrow keys to set the desire percentage (0-100% is 4-20mA), press F1 and then F2
5- Press F2 to go to next display since we are not controlling the output with any type of sensor in Manual Mode
6- If any interlocked needed use UP/Down arrow keys to select one of the digital or phantom inputs then press F1 and then F2 to go to next display
7- If any open loop alarm needed (if the 4-20mA output doesn’t see a closed loop you will get open loop alarm) use F3 to switch back and forth between ON and OFF and F1 to save changes
8- Use ESC key to Exit

10.25.5 Linking a 4-20mA Input with a 4-20mA Output
Any analog input from A to N, including phantom inputs in this range, can be used to control a 4-20mA output. Use the same steps as above and choose that input letter. See sections 10.14.1, 2, 3 and 4. See also section 9.11 Phantom Inputs.

10.25.6 Calibration of a 4-20mA Output
To calibrate 4-20mA output you will need a Multimeter set in mA mode placed in series with the output card and a load. See Figure 65

1- From the HOME display, press the CAL key
2- Using the UP and DOWN ARROW keys choose the 4-20mA Output you would like to calibrate, then press OK.
3- Observe the reading on your mA meter that is in series within your circuit. It should be close to 4.00 mA. Use the ARROW keys to match the controller display with your meter reading and press OK.
4- Press F1 to calibrate 20.0mA output. The display should read about 20.0mA.
5- Use the ARROW keys to match the controller display to your meter reading then press F1 to save.
6- Press F1 to go to Next screen.
7- Choose another output or press ESC to return to the main display

If the calibration was not successful (calibrate limits @ +/-0.5mA @ 4mA & +/-15% on span (about +/-2.4mA).) it will display “Sensor fault Overrange”, consider three choice after fault (RECAL to recalibrate, IGNORE to ignore the fault and accept calibration, RESET to reset calibration back to factory defaults)
The System Menu is accessed by pressing the MENU key followed by the up arrow and the OK key. The following sections discuss the options available and how to edit the information. The options below appear in the order they are in the display if you use the down arrow to scroll.

The choices are:

- Communications
  - User setup
- System Setup
  - Activity Log
- Time and Date
  - Diagnostic
- Set Sensor Type
  - Configurations
- Enable I/O
  - Display Setup

11.1 Communications

The Communications section has the IP addresses for the LAN and WiFi connections. Scroll down through; LAN IP Address, WiFi Netmask Address, WiFi IP Address, LAN Gateway, MAC Address and LAN Netmask.

<table>
<thead>
<tr>
<th>Address Type</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAN IP Address</td>
<td>10.10.6.106</td>
</tr>
<tr>
<td>WiFi Netmask Address</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>WiFi IP Address</td>
<td>192.168.1.1</td>
</tr>
<tr>
<td>LAN Gateway</td>
<td>192.168.100.1</td>
</tr>
<tr>
<td>Mac Address</td>
<td>nn.nn.nn.nn.nn.nn</td>
</tr>
<tr>
<td>LAN Netmask</td>
<td>255.255.255.0</td>
</tr>
</tbody>
</table>

Table 15 IP Addresses

The LAN address and Netmask can be changed if the controller will be on a network. The network administrator must provide a LAN address for this device. Edit them here.

WiFi is how to connect wirelessly. Enable WiFi on your PC, Notebook or Smartphone.

The MAC address is assigned to the controller from the factory and cannot be changed. It is unique in the world.

11.1.1 How to Change the IP Address:

The factory default IP Address of the controller is 10.10.6.106.

You can connect any PC device with an Ethernet port to the controller using a CAT5 Ethernet cable.
Set up your device with a static IP address of 10.10.6.nnn, where, 'nnn' is a 3 digit number from 000 to 255 but not 106. 106 is the unique address of the controller.

Open a browser and enter 10.10.6.106 into the search box to make an HTTP connection to the controller.

Refer to the Browser manual for more details.

If your controller is attached to a local area network (LAN) the IP address of the controller will need to be changed to match the plant scheme. This address is assigned by the site IT staff. Enter that address as shown here.

1. To Edit IP Address press MENU
2. Use Up/Down Arrows to navigate to System then press OK
3. Scroll to Communication then press OK
4. Use F1 to go to Edit Mode
5. Use Up/Down and Left/Right Arrow keys to Edit the IP Address then Press F1 to save the change
6. Press NEXT to go to Netmask setting
7. Use F1 to go to Edit Mode if necessary
8. Use Up/Down and Left/Right Arrow keys to Edit the Netmask then Press F1 to save the change
9. Use ESC key to exit to the main display

11.1.2 Web Interface Wi-Fi

PC's, tablets and phones can connect to the DCM510 via Wi-Fi.

The IP Address and Netmask for Wi-Fi is fixed (hard coded) so the only way to differentiate the connection between controllers is the Wi-Fi SSID #.

The SSID is the name you will see/connect to when using WiFi. From the factory, the last 3 digits of the name will be the same as the last 3 digits of the controller serial number. Should you be in an account that has multiple controllers, you need this to know which unit you are choosing to connect.

Once you are connected and logged in, you can change the SSID to anything you wish. The change will take place after you cycle power to the controller.

See flow chart below to find the fixed IP Address and Netmask for Wi-Fi

SSID: Service set identifier is a name for the wireless network.

The SSID cannot be edited from keypad. A Browser connection must be used.
11.2 System Setup

System Setup has 9 options;

- Site Name
- Controller Name
- Keypad Passwords
- Metric Units
- Sunday = Day 1
- System Type
- Flow Switches
- Flow on Delay
- Alarm on Stops
- System Restart
- Factory Reset

11.2.1 Site Name/Controller Name

You can label this device with two separate names. These names appear in any data file downloaded so as to help delineate these documents. The controller name also shows on the browser tab when connecting with a PC, tablet or Smartphone.

Edit these names using the keypad:

Notice the F2 key represents the word ‘alpha’. You have three choices, ALPHA (upper case letters), alpha, (lower case letters), and NUMBERS, 0 through 9. Since the lower case ‘alpha’ is seen, please realize that this is a choice, not the current selection.

The default choice is upper case so use the up and down arrows to change the first digit. You will see the uppercase letters scroll by. Hold the key down for fast scroll, or press to move one letter at a time. Once you have rested on the letter you choose, press the right arrow to move to the next position.

Press the F2 key to choose alpha, lower case letters. Notice that the F2 choice now shows NUMBERS. That would be the next choice.

When finished, press OK to save.

11.2.2 Keypad Passwords

Use this page to turn password protection ON/OFF. See section 11.6 Passwords to change your password, login or logout.

There are 4 Operator level, 3 Configure level and one Admin login.

The passwords allowed are the same on the keypad as those created/edited via a browser. You can edit your password from either place. Operator level users can see the program parameters but not edit them. Configure level users can change all programming but cannot edit system parameters. The Admin user can edit all user parameters including user name, password and access level. This cannot be performed from the keypad. A browser connection is required. There is not mfg password. If you forget your password, ProMinent can reset the password list. All users would have to re-set their passwords.

<table>
<thead>
<tr>

<td>Configure 7</td>
<td>7</td>
</tr>
<tr>
<td>Administrator</td>
<td>AAAA</td>
</tr>
</tbody>
</table>

Table 16: Default Users Passwords
11.2.3 Metric Units
Toggle Engineering units between standard and Metric.

11.2.4 Sunday=Day 1
Use this if you are setting up timers with a 28 day cycle. Since a 28 day cycle has 4 weeks of timers, setting this as week 1 lets you know that what you set up in week 1 will happen this coming week. (Every week is week 1 in a 7 day cycle.) See more in section 10.6.7 Choosing a Cycle

11.2.5 System Type
System Type can be a single or dual pool control scheme. A two pool scheme allow the user to tag all I/O as pool 1 or pool 2 so as to help identify sensors and controls with the correct body of water.

This also changes how the I/O is presented in the browser view. See the browser manual for more information.

11.2.6 Flowswitches
Select Flowswitches for the outputs. Once selected, you cannot de-select without a reset from a factory technician!

11.2.7 Flow on Delay
This delay holds output relays off for the set time in seconds. This allows sensors to more closely reflect the correct value.

Default is 45 seconds.

11.2.8 Alarm on Stops
Pressing the STOP button at any time will stop all outputs. It will also create an alarm condition unless you change it.

11.2.9 System Restart and Factory Reset
System Restart will reset timers and clear alarms.

Factory Reset will perform a System restart plus all programming will be erased, the date and time will be reset and the controller will reboot. Neither will reset passwords nor change IP addresses.

---

11.3 Time and Date:
To Set Time and Date:

1- Press MENU
2- Use Up/Down Arrows to navigate to System then press OK
3- Scroll to Time & Date then press OK
4- Use Up/Down and Left/Right Arrow keys to set the Time
5- Use F3, Up/Down and Left/Right Arrow keys to set Date
6- Use F2, Up/Down and Left/Right Arrow keys to set Week day then press OK
7- Use ESC key to Exit and back to main display
11.4 Set Sensor Type
See 9.1.1 Enable an Analog or Digital Input

11.5 Enable I/O
See 9.1 Analog and Digital Inputs

11.6 User Setup
Use this section to change your password if the password option is enabled. If not enabled, See 11.2.2 Keypad Passwords to turn protection on/off.

Forgotten passwords can only be reset by a factory representative. The reset will set all passwords back to factory default.

With keypad passwords turned on, login using your current password. Now edit the password and save the change.

1- To Set Keypad password Press MENU
2- Use Up/Down Arrow keys to navigate to SYSTEM then press OK
3- Use Up/Down Arrow keys to navigate to User Setup then press OK

Keep in mind that the choice just before the button is pushed is the selected character type. Example: if the text above F2 says “alpha” pressing the F2 key once changes to lowercase.

5- Enter a new password and press F1 to save.
11.7 Activity Log

**Note:** Most recent activities are shown first.

1. To see the Activity Log, Press **MENU**
2. Use Up/Down Arrow keys to navigate to **SYSTEM** then press **OK**
3. Use Up/Down Arrow keys to navigate to **Activity Log** then press **OK**
4. Use F3 to set the Date (this will be a date that you want to see the activity for all I/O)
5. Set the date using Navigation keys and then press F1
6. The activities will be shown based on the Letters (for inputs) and digits (for outputs)
7. Use F1 key to go to Next activity and use Down arrow key to momentarily see the stamped time for that activity
8. Use ESC key to Exit
11.8 System Diagnostics

Serial #: serial # of the controller

Fan Speed: displays fan speed, Monitoring fan if it fails will go to alarm

O-T wiring: Status of power supplying digital inputs O through T.

U-V wiring: Status of power supplying digital inputs U and V.

Admin Password: Shows Default if it has not been modified from ‘AAAA’. If modified, it will display ‘Changed’.

Watchdog Reset: A Watchdog Reset should always display 0. An increasing number of Resets indicates corrupted firmware or controller electrical fault or interference.

Relay Fuse: Displays the state of the Relay 1 and Relay 2 AC power fuse, Displays “Load Fuse open” if AC fuse is failed. The Board Fuse does not have an alarm. If it fails, the controller is without power.

HMI Firmware: Hood Firmware Version indicates the date of issue of the firmware operating the keypad and display (16.04.06.00 means 2016-April-6th)

Firmware: Mother board Firmware Version indicates the date of issue of the firmware operating the controller (16.08.01.00 means 2016-August-1st)

11.9 Configurations

See section 13.2 USB – Save or Load the Program

11.10 Display Setup

Choose how and what is shown on the display. See section 2.2 Modifying the ‘Home’ Screen
12 Controller Technical Data:

12.1 Fuse Specification

The power relay fuse is 6.3 amps at 250 volts AC. This fuse is similar to the relay fuse used on the MultiFLEX and Aegis, except this is a slow blow fuse. Do not use this fuse in those controllers.

However, you can use the fast blow fuses provided with those controllers in the DCM510. A fast blow fuse will not harm the device.

Table 17 Fuse Specifications

**Fusing Relays R3, R4, and R5 for external power usage**

Relays R3, 4 and 5 can be wired using on-board power as shown in section 6.3.5.4 Wiring Relays R3 – R5 Using On-board Power or powered from an external source as shown in section 6.3.5.5 Wiring Relays R3 – R5 Using an External Power Source. When using external power, fusing must be provided by customer.

These relays are rated for a maximum of 5 amps each when using external power.

*Table 19  Sensor Specifications*
13 Using the USB Port

13.1 Capturing Data

The DCM510 logs all sensors, flow switches, meter values, relay ON times, fed volumes and status every 5 minutes. This data is easily captured from the USB port located behind the communication light cover.

1- Insert a USB flash drive into the USB port shown. The OLED screen will acknowledge the drive.

2- Choose F1, LOG to set up the download.

3- Choose the amount of history, DAY [F1], WEEK [F2], or MONTH [F3]. When you choose the period, the download starts.

During the download, the keypad and browser connection are locked.

4- The display will show the progress of the download.

5- Once complete, the display will show the file name uploaded to the USB flash drive (ending in "csv"), the size of the file in number of records or time stamps, and instructs you to remove the drive to return the controller to normal operation.

6- Don’t forget to close and re-secure the access door to assure the interior of the controller is not subjected to moisture or corrosive fumes from the environment.

No special conversion program or Excel add-in is needed to import the CSV formatted data into Microsoft Excel® or similar spreadsheet programs. Refer to your spreadsheet or graphing software product to learn how to import CSV data. (CSV = Comma Separated Value). The I/O data is stored in 5 minute intervals. (Not adjustable). Values shown are as taken, not averaged over the 5 minute period. Relays show ON time in seconds if on/off. Frequency outputs in volume (mL).

Table 20 Partial example of captured data
13.2 Save or Load the Program Configuration

THESE ARE NOT THE FIRMWARE INSTRUCTIONS. See 13.3 Firmware Upgrade

A program configuration is a list of instructions that the user can edit. Set-points, calibrations, names of I/O are all saved in the program configuration. You can save the configuration via a USB drive for backup purposes or to clone another controller. (Save from one controller and Load the configuration onto another.)

To see how to access the USB port, see section 13.1 Capturing Data.

13.2.1 Saving to the USB

1- To save a copy of your current program onto a USB drive, insert a USB into the USB port located behind the Communication panel.

2- Press F3 Config

3- If you have not previously saved a program on this USB you can only F1 SAVE a copy to the USB.

4- If you have a previously saved program, you have the choice of saving F1 or loading F3.

In either case, press F1 SAVE to copy the current configuration to the USB drive. When the save is complete, the display will notify you to remove the USB drive.

13.2.2 Loading from the USB

1- To load a previously saved program from the USB to your controller, insert a USB into the USB port located behind the Communication panel.

2- Press F3 Config.

3- Press F3 Load.

4- The controller loads the program from your USB and notifies you to remove it.

Sometimes referred to as “Cloning”, a saved program file can be loaded onto a different DCM510 controller. They will then have the same configuration. Afterwards, you can edit either program via the keypad or with a PC, etc.

13.2.3 Saving to/from flash

A copy of the configuration can be saved to the controller flash memory for immediate recall at a later time.

Press Menu, scroll up to System and press OK. Scroll up to Configuration and press OK. Save or load a configuration.
13.3 Firmware Upgrade

If necessary, your controller can have the firmware upgraded. Firmware is a set of instructions which tell the controller CPU how to operate. Firmware is not your ‘program configuration’ which determines which relay operates when and how. The program configuration can be saved and if needed, re-loaded, or copied to another controller. See section, 13.2 Save or Load the Program Configuration

1 File Please

To avoid accidents and confusion with this important process, please remove all files from the USB drive prior to adding the .hex file. The controller will only allow you to view one file. Be sure you copy the correct file to the USB. If you have more than one, you may load the wrong file.

1- Obtain the hex file from ProMinent and insert thumb drive with the new file into the USB port located behind the Communication panel. See section 13.1 Capturing Data.

2- Press F2, UPDATE

3- The display shows the one file from the USB drive; APQ17060500.hex and the current hex file in use; Running:16.10.13.00. NOTE: These numbers are date codes, year, month and day. ‘00’ indicates they come from the USB drive.

F2 “OLDPGM” is a list of hex programs on the controller. If OLDPGM is not a choice, there are no other backup hex files in the controller memory. You can load a previous program from this list.

4- If the file on line 2 is the new firmware file, press F1 NEWPGM to select the new hex file. Press F1, Load to install the new hex file.

5- Remove the USB drive when prompted.

NOTE: OLDER FIRMWARE VERSIONS USE STEP 6.

6- The firmware is copied to the controller. When complete, the controller will notify you to remove the USB drive.

7- After you remove the drive, the controller will erase the existing firmware and install the new one.

8- Once the new firmware is installed, the controller will restart.
13.4 E-mail Reports and Alarms

The E-mail function is explained in the DCM510 Browser manual. You cannot access this feature through the keypad. The following explanation is for informational purposes only.

The E-mail tool can send three types on information; Alarms, Status and Daily data. Setup is via a PC or smart phone browser.
During controller power up or reset, E-mail initializes as disabled.

13.4.1 E-mail Types:

13.4.1.1 ALARM: Sent once when an alarm first occurs.
List all active alarms.
Includes enabled sensor, meter & contact values for alarm context
User Enabled/Disabled.

13.4.1.2 STATUS: Sent @ noon every day (12:00). Verifies that the controller is running & on the LAN.
Includes enabled sensor, meter & contact values.
Sent @ midday so that commercial systems will have some run time and some day is left to respond to operating issues.

13.4.1.3 DAILY: Sent @ midnight (23:59) every day. Verifies that the controller is running & on the LAN.
Includes enabled output run times or volumes and sensor, meter & contact values. User Enabled/Disabled.
All types send comma delimited values (CSV); one line per I/O or Alarm so that the both the subject & body can be easily parsed into a logging app, a typical use for the DAILY type.
Will make text-to-speech entertaining (bit encoded value-states are therefore intentionally excluded).
14 Spare Parts and Accessories

14.1 DCM510 Controller – base and cards

- Lower body section RAL5003 No electronics 1020595
- DCM5b Motherboard Programmed 1081894
- A2 WLAN (WiFi module) 734211

14.4.2 Potentiometric Sensors and Accessories

- Coax cable, SN2 x Clamp, 32” 1024105
- Coax cable, SN2 x Clamp, 6’ 1024106
- Coax cable, SN2 x Clamp, 30’ 1024107
- PHED to 4-20mA converter 809126
- RHEP to 4-20mA converter 809127
- RHEP-Au-Se Gold pin ORP electrode Salt pools 1003875
- ORP sensor – Aquatics 7500442
- pH sensor – Aquatics 7500441
- Conductivity Temperature Flowswitch -Serial 1094802
- Temp sensor Assembly† PT1000 & adapter for DGMA 1082254
- Resistance thermometer Pt-1000-SE 1080101
- Temp sensor adapter for SGT or PT1000 to DGMA 1051504

14.4.3 Cable

- Ethernet Adaptor - DCM2/DCM5 7500607
- Cable, 2 conductor 22ga w/shield Quantity in feet 7760527
  Use this cable to lengthen low voltage sensors or any 4-20mA signal.

14.4.4 Amperometric Sensors and Accessories

- CLE 3-mA-2 ppm sensor 0.02 to 2.0 mg/l 792920
- CLE 3-mA-10 ppm sensor 0.10 to 10.0 mg/l 792919
- CLO 1-mA-2 ppm sensor 0.02 to 2.0 mg/l 1033871
- CLO 1-mA-10 ppm sensor 0.10 to 10.0 mg/l 1033870
- CGE 3-mA-2 ppm sensor 0.02 to 2.0 mg/l 1047959
- CGE 3-mA-10 ppm sensor 0.10 to 10.0 mg/l 1047975
- CTE 1-mA-2 ppm sensor 0.02 to 2.0 mg/l 740685
- CTE 1-mA-10 ppm sensor 0.10 to 10.0 mg/l 740684
- CBR 1-mA-2 ppm sensor 0.02 to 2.0 mg/l 1038015
- CBR 1-mA-10 ppm sensor 0.10 to 10.0 mg/l 1038014
- Membrane cap for CLE3 790488
- Sensor cap for CLO 1 1035197
- Membrane cap for CGE/CTE 1 792862
Membrane cap for CBR 1 741274
Accessory set CGE 2/CTE 1 (2/5/10ppm) 2 caps/elect 740048
Accessory set CLE (2 mem caps + 100mL electrolyte) 1024611
Accessory set CLO 1 (100mL electro, grinding disc. Plug) 1035482
Accessory set CBR 1 (2 mem caps + 100mL electrolyte) 1038984
Electrolyte for all CLE chlorine sensors 100mL 506270
Electrolyte CGE/CTE/BRE sensors 50mL 792892
Electrolyte CLO 1 100mL 1035191
Electrolyte CBR 1 100mL 1038017

14.4.5 DGMA Sensor Header
Please consult the DGMA manual, available on the ProMinent.us website for parts and maintenance instruction.

15 Maintenance
The DCM510 Controller is maintenance free. Replace the battery after 10 years as a precautionary measure.

Battery type: BR2032, 3 V approx. 190 mAh
The battery is clamped in a holder on the Top center of the main board

Figure 67 AGlb battery

Removing the battery
1. Unscrew the four retaining screws at the front on the housing upper section and take the housing upper section off from the housing lower section.
2. Press on the holder lug to release the battery from the holder, see Fig. 66
3. Insert a new battery in the holder, In so doing avoid pressing with the fingers on the battery poles. This will result in poor contacts.
4. Place the housing upper section on the housing lower section
5. Manually tighten the four retaining screws

NOTICE!
Hazardous waste
The battery is hazardous waste. It must be disposed of separately. Observe the conditions which apply on your site.

CAUTION!
Solvent
Do not under any circumstances use solvent to clean the surfaces. Solvent can attack the surfaces.
Clean the housing with a damp cloth. Then rub dry.
16 Certifications

The Aegis II/DCM510 Controller is built to conform to UL/CSA/IEC 61010-1 for safety. Additional information can be found on our website www.prominent.us.

![Certification Logo]

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

FCC ID: W7OMRF24WG0MAM

17 Necessary formalities

17.1 Disposal of used parts

Users' qualification: instructed persons, see Section 4.5 Users' qualifications.

**NOTICE!**

Regulations governing disposal of used parts
- Note the current national regulations and legal standards which apply in your country

17.2 Agency Approvals

Safety: UL 61010-1, 3rd Edition
CSA C22.2 No. 61010-1-12, 3rd Edition
IEC 61010-1, 3rd Edition
EN 61010-1, 3rd Edition
