Operating Instructions
DULCOMETER® D1C
Part 2: Adjustment and Operation, Measured Variable Standard Signal

Please completely read through operating instructions! · Do not discard!
The warranty shall be invalidated by damage caused by operating errors!

Please enter the identity code of your device here!

Part no. 987528   ProMinent Dosiertechnik GmbH · D-69123 Heidelberg · Germany   BA DM 147 04/07 GB
### D1C A DULCOMETER® Controller Series D1C / Version A

#### Type of mounting

- **D**: Control panel installation 96 x 96 mm
- **W**: Wall mounting

#### Operating Voltage

- **0**: 230 V 50/60 Hz
- **1**: 115 V 50/60 Hz
- **2**: 200 V 50/60 Hz (only with panel installation)
- **3**: 100 V 50/60 Hz (only with panel installation)
- **4**: 24 V AC/DC

#### Measured Variable

- **S**: Standard signal 0/4-20 mA

#### Connection of measured variable

- **1**: Terminal standard signal 0/4-20 mA

#### Correction variable

- **0**: None

#### Feed forward control

- **0**: None
- **1**: As standard signal 0/4-20 mA
- **2**: As frequency 0-500 Hz
- **3**: As frequency 0-10 Hz

#### Control input

- **0**: None
- **1**: Pause

#### Signal output

- **0**: None
- **1**: Standard signal 0/4-20 mA measured value
- **2**: Standard signal 0/4-20 mA control variable
- **4**: 2 standard signal 0/4-20 mA outputs, free programmable

#### Power control

- **G**: Alarm and 2 limit value/timer relays
- **M**: Alarm and 2 solenoid valve relays
- **R**: Alarm relay and servomotor with feedback

#### Pump control

- **0**: None
- **2**: Two pumps

#### Control characteristics

- **0**: None
- **1**: Proportional control
- **2**: PID control

#### Log output

- **0**: None

#### Language

- **D**: German
- **E**: English
- **F**: French
- **I**: Italian
- **N**: Dutch
- **S**: Spanish
- **P**: Polish
- **A**: Swedish
- **B**: Portuguese
- **U**: Hungarian
- **G**: Czech

Please enter the identity code of your device here!
2 General User Information

These operating instructions describe the technical data and function of the series DULCOMETER® D1C controller, provide detailed safety information and are divided into clear steps.

IMPORTANT

- Please observe the parts of these operating instructions applicable to your particular version! This is indicated in the Section “Device Identification / Identity Code”!
- Correct measuring and metering is only possible in the case of impeccable operation of the sensor. The sensor has to be calibrated / checked regularly!

NOTE

A form “Documentation of controller settings type D1C” is available under www.prominent.com/documentation_D1C for the purpose of documenting the controller settings.
3 Device Overview / Controls

CHANGE button
To change over within a menu level and to change from one variable to another within a menu point.

UP button
To increase a displayed numerical value and to change variables (flashing display).

START/STOP button
Start/stop of control and metering function.

BRANCH BACK button
Back to permanent display or start of relevant setting menu.

ENTER button
To accept, confirm or save a displayed value or status. For alarm acknowledgement.

DOWN button
To decrease a displayed numerical value and to change variables (flashing display).
4 Functional Description

NOTE
Please refer to the description of the complete operating menu in Section 8 for a detailed description of the individual characteristics of the D1C controller!

4.1 Operating Menu
The DULCOMETER® D1C controller permits settings to be made in two different menus – a "complete" and a "restricted" menu. All values are preset and can be changed in the complete operating menu.

The controller is delivered with a restricted operating menu so that the D1C controller can be used effectively in many applications from the very onset. If adaptations prove to be necessary, all relevant parameters can then be accessed by switching over to the complete operating menu (see "General settings").

4.2 Access Code
Access to the setting menu can be prevented by setting up an access code. The D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even if access to the setting menu is blocked by the code.

4.3 Control
The D1C can operate as a proportional controller or as a PID controller - depending on the device version (see identity code) and the setting.

The controlled variable is recalculated once a second. Control procedures which require rapid correction of setpoint deviations (less than approx. 30 seconds) cannot be processed with this controller. The cycle times must be taken into consideration when activating solenoid valves (pulse length) in the same way as their running times when activating servomotors (3-point).

Via the control input pause, the control function (selection of controlled variable) can be switched off. The calculation of the controlled variable starts again after cessation of "pause".

4.4 Feed Forward Control
The D1C controller can process a signal of a feed forward control. Depending on the device version (see identity code) and the setting, this signal can be obtained in any form of a 0–20 mA or 4–20 mA signal or as a digital contact signal with the maximum frequencies 10 Hz or 500 Hz.

This signal can be used, for example, for flow-proportional metering (multiplicative effect) or feedforward-dependent basic load metering (additive effect). The result of control variable calculation from the proportional or PID control is multiplied by or added to the feedforward signal. A multiplicative feedforward variable at the level of the set rated value carries over the calculated control variable unchanged into the controlled variable:

\[
\text{Controlled variable} = \frac{\text{Feedforward variable}}{\text{rated value}} \times \text{calculated control variable}
\]

During start-up, the zero point has to be checked. The multiplicative feed forward control is not designed for switching off permanently the actuating variable (signal \( \approx 0 \)).

An additive feedforward variable at the level of the rated value results in maximum controlled variable:

\[
\text{Controlled variable (max. 100 %)} = \frac{\text{Feedforward variable}}{\text{rated value}} \times \text{max. controlled variable} + \text{calculated control variable}
\]

4.5 Error Messages
Error messages and information are indicated on the bottom line in the permanent display 1. Errors to be acknowledged (acknowledgement switches off the alarm relay) are indicated by the "\( \mathcal{E} \)". Errors/notes which still apply after acknowledgement are indicated alternately. Faults which are rectified of their own accord due to changed operating situations are removed from the permanent display without the need for acknowledgement.
# Display Symbols

The display of the DULCOMETER® D1C controller uses the following symbols:

<table>
<thead>
<tr>

5 Display Symbols
NOTE
Access to the setting menus can be barred with the access code!
The number and scope of setting menus depends on the device version!
If the access code is selected correctly in a setting menu, the following setting menus are also accessible!
If within a period of 10 minutes no button is pushed, the unit automatically branches back from the calibrating menu or a setting menu to the permanent display 1.
The restricted operating menu permits simple operation of the most important parameters. The following overview shows the settings which can be selected:

- **Permanent display 1**:
  - Measured value:
  - 12.3 %
  - Limit setpoint:
  - 100 %

- **Permanent display 2**: Only with control (w = setpoint)

- **Positive values of setting variable**:
  - 50 %

- **Negative values of setting variable**:
  - 0 %

- **Calibration zero-p.**:
  - 4.00 mA
  - Slope:
  - 100 %

- **Calibration meas. value**:
  - 14.5 %

- **Control settings?**
  - Only with control

- **Control regulated value**: Positive
  - 30 %

- **Control regulated value**: Negative
  - 30 %

- **Setpoint**:
  - 50 %

- **Control with dead zone**
  - Setpoint 2 upper:
  - 10 %
  - Setpoint 2 lower:
  - 28 %

- **Manual control**
  - Manual dosing:
  - 15 %
  - Regulated range:

- **Limits setting?**
  - Limit 1 upper:
  - 30.0 %
  - Limit 1 lower:
  - 26.0 %

- **General setting information**
  - Ident-code: D1C2
  - DxxSxxxxxx
  - Software version:
  - D1C-B1 FW-5.00

- **Access to setting menus can be blocked with access code.**
Calibration of the standard signal (zero-point calibration)

The D1C sets the control output to “0” during the calibration procedure. Exception: When a basic load or a manual control variable is set the corresponding parameter is retained during calibration. The standard signals outputs mA (measured value) are frozen. The measured value frozen at the start of calibration is the proposed value. This value is adjustable (arrow buttons!). Calibration is possible only when the value is ≥ 2 % of the measuring range. Following successful calibration, all troubleshooting procedures relating to the measured value are restarted.

**IMPORTANT**

The measuring range of the sensor must agree with the set measuring range. The unit of measure must be set prior to calibration (see Page 14)!

Access to all setting menus can be blocked with an access code!
## Restricted Operating Menu / Description

</tr>
</tbody>
</table>

**IMPORTANT**

When changing the range adjustment, the sensor must be newly calibrated and the adjustments in all menus have to be checked!

This function may not be activated for applications in which it can be assumed that the measured value will not change.

This function tests whether the measured value changes from that of the sensor (at the measured value input) within the "Measured value checkout time". It is assumed that it will do so for an intact sensor.

If the measuring value does not change during this checkout time, the DULCOMETER® D1C sets the control variable to "0" and the alarm relay drops out. The LCD display shows e.g. the message "limit 1/2".

*for other measuring ranges see page 9

*for other measuring ranges see page 9

Constant measurement signal results in message and alarm. Function off = 0 s

---

  - Limit value 2* (if relay 2 is active)
  - Actuator 2
  - Timer 2 off

**Period**
- min. time: 10 s
- max. time: 10 s

**Period off**
- min. time: 10 s
- max. time: 9999 s

**Period on**
- min. time: 1 s
- max. time: 1 s

**Remarks**
- "At "limit value": the relays remain active even in the case of fault.
- Only with limit relay, solenoid valve relay or servomotor relays.
- Setting:?
- Actuation:1
- Off: 1 h
- On: 1 min
- for timer

**NOTE**
The limit value relay can be defined in such a way as to respond as a control element, i.e. if a limit value relay closes a circuit, it opens when a pause contact is activated and/or for a subsequent delay period $t_d$ (if $t_d$ is set to > 0 min in "General settings").
Complete Operating Menu / Description

**IMPORTANT**

The timer will reset in the event of a power failure.

At the end of the (timer) cycle time the DULCOMETER® D1C closes the assigned relay for the duration of “t on” (timer). “Pause” interrupts the timer.

When the clock is shown in the LC display the timer can be reset to the start of the cycle at precisely this point using the enter button.

The % figure in the LC display indicates the progress of the current cycle. Timer relays may be used, e.g. for shock metering or sensor cleaning.

The switching time of the DULCOMETER® D1C (solenoid valve) depends on the actuating variable and the “min. time” (smallest permitted operating factor of the connected device). The actuating variable determines the ratio t_on/cycle and thus the switching times (see fig. above). The “min. time” influences the switching times in two situations:

- **a) theoretical switching time < min. time:**

  ![Diagram showing theoretical switching time < min. time](image)

  The DULCOMETER® D1C does not switch for a certain number of cycles until the sum of the theoretical switching times exceeds the “min. time”. Then the DULCOMETER® D1C switches for the duration of this total time.

- **b) theoretical switching time > (cycle - min. time) and calculated switching time < cycle**

  ![Diagram showing theoretical switching time > (cycle - min. time) and calculated switching time < cycle](image)

  The DULCOMETER® D1C does not deactivate for a certain number of cycles until the differences between cycle and theoretical switching time exceed the “min. time”.

</tbody>
</table>

If the limit transgression is applied longer than the "delay time limit values", an error message is triggered and the alarm relay drops out; the control procedure stops if "control" is additionally set to "off".
**Complete Operating Menu / Description**

**Servomotor**

The **operating range** is defined by the total resistance range of the feedback potentiometer. The maximum limit of the range actually used is set by defining the **control range**.

**IMPORTANT**

- Activation of the servomotor must be carried out with the same meticulous care as taken when calibrating a measuring sensor.
- To ensure correct operation, the activation time of the actuator used should not be less than 25 seconds for the control range from 0…100 %!

Access to all setting menus can be blocked with an access code.

<table>
<thead>
<tr>
<th>servomotor setting ?</th>
<th>servomotor</th>
<th>servomotor open ?</th>
<th>servomotor opened ! value take over ?</th>
<th>servomotor close ?</th>
<th>servomotor closed ! value take over ?</th>
<th>servomotor OK : current position:</th>
</tr>
</thead>
</table>

### Possible values

<table>

<tr>
<th>Servomotor Setting</th>
<th>Setting ok</th>
<th>off</th>
</tr>
</thead>
<tbody>
<tr>
<td>Control direction</td>
<td>100 %</td>
<td>1 %</td>
</tr>
<tr>
<td>Control range</td>
<td>in % of operating range</td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

- When the wide bar is as right as it will go, the stroke adjustment motor is fully open.
- The permanent display shows to what degree the motor has opened in % (the greater the percentage, the more open the servomotor.)
Complete Operating Menu / Description

Access to all setting menus can be blocked with an access code!

Note: The controlled variable is recalculated every second. Only suitable for processes with time constants greater than 30 s!

Abbreviation for control variables:
\[ x_p = \frac{100 \%}{K_p} \] (inverse proportional coefficient)
\[ T_i = I \text{ controller integration time [s]} \]
\[ T_d = D \text{ controller differential time [s]} \]

Control with standard signal

Only with 2 standard signal outputs

Access to all setting menus can be blocked with an access code!

Control with standard signal

Variable allocation

- as per identity code

Output range

- 0...20 mA

Measured value

- 0...20 mA

Controlled variable

- 0...20 mA

- 4...20 mA

- 3.6/4-20 mA

Possible values

Initial value | Increment | Lower value | Upper value | Remarks
--- | --- | --- | --- | ---
Variable allocation | as per identity code | Measured value | Controlled variable | If control applicable
Output range | 0...20 mA | 0...20 mA | 0% | 0% | Reduction to 3.6 mA when alarm relay switches (not limit value violation)
Range measured value | 0-100 % | 0,1 % | -5 % | 105 % | Minimum range 1 % of measured value
Range controlled variable | 0 %...+100 % | 1 % | -100 % | +100 % | Minimum range 1 %

General setting

Access to all setting menus can be blocked with an access code!

**Normal pause**

If the pause switch is off, the DULCOMETER® D1C sets the operating outputs to “0” for as long as the pause switch is off or for a set time delay t<sub>d</sub> (if t<sub>d</sub> is set to > 0 min). While the pause switch is off, the D1C establishes the P-proportion in the background.

With PID-control (identity code characteristics “control characteristic” = 2): the I-proportion is stored when the pause is switched off (I-proportion then usually only present if Ti > 0 has been selected in the “Control setting?” setting menu).

Exception: the standard signal outputs mA for the measured value or correction value are not affected by the pause.

After pause is activated, the operating outputs remain at “0” for the length of the time delay td. The time delay td must be set up in such a way that in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (identity code characteristics “control characteristic” = 2): The control variable output resulting from the pause and the expiry of the time delay td is reconciled jointly with the current P-component and (if Ti is set > 0) with the stored I-component.

**Pause hold**

If the pause switch is off, the DULCOMETER® D1C freezes the operating output at the most recent value for as long as the pause switch is off or for a set time delay t<sub>d</sub> (if t<sub>d</sub> is set to > 0 min). Whilst the pause switch is off, the D1C establishes the P-proportion in the background.

With PID-control (identity code characteristics “control characteristic” = 2): Even the mA standard signal outputs for measured value or correction value are frozen.

After pause is activated, the operating outputs remain frozen for the length of the time delay td. The time delay td must be set up in such a way that in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (identity code characteristics “control characteristic” = 2): The control variable output resulting from the pause and the expiry of the time delay td is reconciled jointly with the current P-proportion and (if Ti is set > 0) with the newly established I-proportion.

**Access Code**

Access to the setting menu can be prevented by setting up an access code. The DULCOMETER® D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even when access to the setting menu is blocked by the code.
