Operating instructions
Precision Piston Metering Pump
mikro delta® MDLa
with controlled solenoid drive optoDrive®

Please carefully read these operating instructions before use! Do not discard!
The operator shall be liable for any damage caused by installation or operating errors!
Technical changes reserved.
Read the following supplementary information in its entirety! Should you already know this information, you have an even greater need of the Operating Instructions.

The following are highlighted separately in the document:

- Enumerated lists
- Instructions
- Results of the instructions

**Information**

_This provides important information relating to the correct operation of the system or is intended to make your work easier._

**Safety information**

Safety information is identified by pictograms - see Safety Chapter.

**User information**

Please read these operating instructions carefully before use! Do not discard!

**State the identity code and serial number**

Please state identity code and serial number, which you can find on the nameplate when you contact us or order spare parts. This enables the device type and material versions to be clearly identified.

**General non-discriminatory approach**

In order to make it easier to read, this document uses the male form in grammatical structures but with an implied neutral sense. It is aimed equally at both men and women. We kindly ask female readers for their understanding in this simplification of the text.

2 About this pump

Properties of the device

The solenoid metering pumps belonging to the mikro delta® product range with controlled optoDrive® solenoid drive are microprocessor-controlled solenoid metering pumps with the following characteristics:

- Output range 150-1500 ml/h, 60 - 20 bar
- Lifting volume 1-250 µl
- Material versions PTFE and stainless steel
- Metering reproducibility: ±0.5 %
- Continuous or pulsing operation
- Adaptation of the pump to the feed chemical
- Continuous stroke length adjustment from 0 - 100 %
- Adjustment and display of the feed rate, either as strokes/min, strokes/h or l/h via the keyboard
- Large illuminated graphic display
- External activation via potential-free contacts with pulse step-up and step-down
- Option of external activation by standard signal 0/4-20 mA (optional)
- Interface for PROFIBUS® or CANopen (optional)
- 14-day process timer* for time- and event-dependent metering tasks (optional)
- Connection for 2-stage level switch
- 3 LED display for operation, LCD screen for warning and fault reporting in the display
3 Safety chapter

Explanation of the safety instructions

The following signal words are used in these operating instructions to denote different severities of danger:

<table>
<thead>
<tr>
<th>Signal word</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>WARNING</td>
<td>Denotes a possibly dangerous situation. If this is disregarded, you are in a life-threatening situation and this can result in serious injuries.</td>
</tr>
<tr>
<td>CAUTION</td>
<td>Denotes a possibly dangerous situation. If this is disregarded, it could result in slight or minor injuries or material damage.</td>
</tr>
</tbody>
</table>

Warning signs denoting different types of danger

The following warning signs are used in these operating instructions to denote different types of danger:

<table>
<thead>
<tr>
<th>Warning signs</th>
<th>Type of danger</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="circle.png" alt="Warning symbol" /></td>
<td>Warning – automatic start-up.</td>
</tr>
<tr>
<td><img src="hand.png" alt="Warning symbol" /></td>
<td>Warning – hand injuries.</td>
</tr>
<tr>
<td><img src="high-voltage.png" alt="Warning symbol" /></td>
<td>Warning – high-voltage.</td>
</tr>
<tr>
<td><img src="danger-zone.png" alt="Warning symbol" /></td>
<td>Warning – danger zone.</td>
</tr>
</tbody>
</table>

Correct and proper use

- The pump may only be used to dose liquid metering chemicals.
- The pump may only be started up after it has been correctly installed and commissioned in accordance with the technical data and specifications contained in the operating instructions.
- Observe the general limitations with regard to viscosity limits, chemical resistance and density - see also ProMinent-resistance list (In the product equipment catalogue or at www.prominent.com)!
- Any other uses or modifications are prohibited.
- The pump is not intended for the metering of gaseous media or solids.
- The pump is not intended for the metering of explosive media.
- The pump is not intended for operation in hazardous locations.
- The pump is not intended for exterior applications without use of suitable protective equipment.
The pump should only be operated by trained and authorised personnel, see the following "Qualifications" table.

You are obliged to observe the information contained in the operating instructions at the different phases of the device's service life.

---

**Safety information**

**WARNING!**

**Warning about personal and material damage**

The pump can start to pump, as soon as it is connected to the mains voltage.

- Install an emergency cut-off switch in the pump power supply line or integrate the pump in the emergency cut-off management of the system.

---

**WARNING!**

**Danger of electric shock**

A mains voltage may exist inside the pump housing.

- If the pump housing has been damaged, you must disconnect it from the mains immediately. It may only be returned to service after an authorised repair.

---

**WARNING!**

**Warning of crushing of the fingers**

The moving parts in the turret can crush fingers.

- The protective bush on the liquid end must always be closed when the pump is ready for operation.

---

**WARNING!**

**Fire danger**

Combustible media may only be transported using stainless steel dosing heads. In exceptional cases where this is not possible, PTFE with carbon can be used, whereby our TT_ versions are manufactured from this conducting plastic. Here, the operator is urged to take special care due to the low mechanical strength.
**WARNING!**
**Warning of hazardous or unknown feed chemical**
Should a hazardous or unknown feed chemical be used, it may escape from the hydraulic components when working on the pump.
- Take appropriate protective measures before working on the pump (protective eyewear, protective gloves, ...). Read the safety data sheet on the feed chemical.
- Drain and flush the liquid end before working on the pump.

**CAUTION!**
**Warning of feed chemical spraying around**
Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.
- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

**CAUTION!**
**Warning of feed chemical spraying around**
An unsuitable feed chemical can damage the parts of the pump contacted by the chemical.
- Take into account the resistance of the materials which will come into contact with the chemical when selecting the feed chemical - refer to the ProMinent resistance list in the product equipment catalogue under [www.prominent.com](http://www.prominent.com).

**CAUTION!**
**Warning of feed chemical spraying around**
The metering pump can generate a multiple of its rated pressure. If a discharge line is blocked, hydraulic parts may burst.
- Correctly install a back pressure valve in the discharge line behind the metering pump.
CAUTION!
Small quantities of feed chemical can escape
Due to its design, small quantities of feed chemical escape at the piston. Therefore appropriate safety precautions must be taken if toxic media are being metered.
  – If toxic feed chemicals are being metered, take appropriate safety precautions. Observe the safety data sheet for the feed chemical.

CAUTION!
Danger of personnel injury and material damage
The use of untested third party parts can result in personnel injuries and material damage.
  – Only fit parts to metering pumps, which have been tested and recommended by ProMinent.

CAUTION!
Danger from incorrectly operated or inadequately maintained pumps
Danger can arise from a poorly accessible pump due to incorrect operation and poor maintenance.
  – Ensure that the pump is accessible at all times.
  – Adhere to the maintenance intervals.

CAUTION!
Danger from incorrect metering
Should a different liquid end size be fitted, this will change the metering behaviour of the pump.
  – Have the pump reprogrammed in the works.

CAUTION!
Warning of illegal operation
Observe the regulations that apply where the unit is to be installed.

Information in the event of an emergency
In the event of an electrical accident, disconnect the mains cable from the mains or press the emergency cut-off switch fitted on the side of the system!

If feed chemical exits, switch off the pump by pressing the [Stop/Start] key. If necessary depressurise the hydraulic system around the pump. Observe the safety data sheet for the feed chemical.
### Safety chapter

#### Qualification of personnel

<table>
<thead>
<tr>
<th>Activity</th>
<th>Qualification level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storage, transport, unpacking</td>
<td>Instructed person</td>
</tr>
<tr>
<td>Assembly, installation of hydraulic system</td>
<td>Technical personnel, service</td>

</tr>
<tr>
<td>Decommissioning, disposal</td>
<td>Technical personnel, service</td>
</tr>
<tr>
<td>Troubleshooting</td>
<td>Technical personnel, electrical technician, instructed person, service</td>
</tr>
</tbody>
</table>

#### Explanation of the terms:

**Technical personnel**

A qualified employee is deemed to be a person who is able to assess the tasks assigned to him and recognise possible dangers based on his/her technical training, knowledge and experience, as well as knowledge of pertinent regulations.

**Note:**

A qualification of equal validity to a technical qualification can also gained by several years employment in the relevant work area.

**Electrical technician**

Electrical technicians are deemed to be people, who are able to complete work on electrical systems and recognize and avoid possible dangers independently based on their technical training and experience, as well as knowledge of pertinent standards and regulations.

Electrical technicians should be specifically trained for the working environment in which they are employed and know the relevant standards and regulations.

Electrical technicians must comply with the provisions of the applicable statutory directives on accident prevention.

**Instructed person**

An instructed person is deemed to be a person who has been instructed and, if required, trained in the tasks assigned to him/her and possible dangers that could result from improper behaviour, as well as having been instructed in the required protective equipment and protective measures.

**Customer Service department**

Customer Service department refers to service technicians, who have received proven training and have been authorised by ProMinent or ProMaqua to work on the system.

---

**Sound pressure level**

Sound pressure level $L_{pA} < 70$ dB in accordance with EN ISO 20361:2010-10

at maximum stroke length, maximum stroke rate, maximum back pressure (water)
4 Storage, transport and unpacking

Safety information

WARNING!
The pump can tip over when lifting
The pump can tip over when lifting, as the centre of gravity of the pump is quite a distance from the liquid end.
- Grip the pump quite close to the liquid end.

WARNING!
The transporting of pumps which have been used with radioactive feed chemicals is forbidden!
They will also not be accepted by ProMinent!

WARNING!
Only return metering pumps for repair in a cleaned state and with a flushed liquid end - refer to the section on decommissioning!

Only send metering pumps with a filled in Decontamination Declaration form. The Decontamination Declaration constitutes an integral part of an inspection / repair order. A unit can only be inspected or repaired when a Declaration of Decontamination Form is submitted that has been completed correctly and in full by an authorised and qualified person on behalf of the pump operator.

The "Decontamination Declaration Form" can be found in the Appendix or at [www.prominent.com](http://www.prominent.com).

CAUTION!
Danger of material damage
The device can be damaged by incorrect or improper storage or transportation!
- The unit should only be stored or transported in a well packaged state - preferably in its original packaging.
- The packaged unit should also only be stored or transported in accordance with the stipulated storage conditions.
- The packaged unit should be protected from moisture and the ingress of chemicals.
**Storage, transport and unpacking**

**Scope of supply**

Compare the delivery note with the scope of supply:

- Metering pump with mains power cable
- Connector kit for hose/pipe connection
- Edge pin (TT_ only)
- Product-specific operating instructions with EC Declaration of Conformity
- Relay cable, as necessary

</tr>
</tbody>
</table>

[i]

Pressed 1x
Change between the continuous displays
Change between "Changing individual numbers" and "Changing a number"

Pressed 2x
-                                            Under "Changing individual numbers": jump to the first number

Press and hold
Change to the secondary display
-                                            

[UP], [DOWN]
Individually pressed (until double arrow appears)
Changing directly changeable variables
Select another setting, change individual number or number.
At the top end of a selection, effect similar to an ESC key.

Pressed simultaneously
Suction (in continuous display "Stroke rate")
-                                            

5.2.2 Stroke length adjustment knob
The stroke length can be adjusted using the stroke length adjustment knob and with it the volume per stroke.

5.2.3 Identifiers
The LCD screen supports the operation and adjustment of the pump with different identifiers:

Fig. 5
The identifiers have the following meanings:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Additional symbol</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Priming]</td>
<td></td>
<td>Priming:</td>
<td>The pump is currently priming (both arrow keys pressed).</td>
</tr>
<tr>
<td>![Symbol for P-key]</td>
<td></td>
<td>Symbol for P-key:</td>
<td>The pump is in adjustment mode.</td>
</tr>
<tr>
<td>![Lock symbol]</td>

*The pump only shows the metering volume and the capacity in the calibrated state in ml or ml/h.*
6 Functional description

6.1 Liquid end

The dosing process is performed as follows: The piston is pressed into the dosing head; the pressure in the dosing head closes the suction valve and the feed chemical flows through the discharge valve out of the dosing head. The piston is now drawn out of the dosing head; the discharge valve closes due to the negative pressure in the dosing head and fresh feed chemical flows through the suction valve into the dosing head. One cycle is thus completed.

6.2 Drive unit

The displacement body is driven by an electromagnet, which is controlled by an electronic control.

optoDrive® drive technology

The optoDrive® drive technology means the variation over time of the metering flow can be precisely matched to the requirements of the particular application. Hence the user can, dependent on requirements, set a slow discharge stroke for nearly continuous metering or a quick stroke e.g. for quick clocked filling processes. In both operating modes it is possible, to selectively also slow the suction stroke, see figure. In this way, it is possible to prevent the main cause for imprecise metering with high viscosity feed chemicals, namely the incomplete filling of the liquid end. For the case of gaseous feed chemicals, the slow suction stroke prevents cavitation and consequently increases metering accuracy. Oscillations in the back pressure in the metering line, which could lead to undesirable variations in the metering volume, are automatically compensated for by the drive. Consequently, a dosing precision is attained, which otherwise could only be achieved using a complex control circuit.

Fig. 6: Metering types: a) pulsing, b) nearly continuous

6.3 Capacity

The capacity is determined by the stroke length and rate.

The stroke length is adjusted by the stroke length adjustment knob within a range of 0 ... 100 %. A stroke length of between 4 ... 100 %) is recommended to achieve the specified reproducibility.
The stroke rate can be set using the arrow keys (not in "Analog" operating mode) in the range 0 - 100 strokes/min (100 strokes/min = 6000 strokes/h). The "Stroke rate (strokes / min)" continuous display shows decimal places if a stroke frequency is set in the "Stroke rate (strokes / h)" continuous display, which cannot be divided by 60 without a remainder.

<table>
<thead>
<tr>
<th>Data</th>
<th>Value</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recommended stroke length</td>
<td>4 ... 100</td>
<td>%</td>
</tr>
</tbody>
</table>

The stroke speed can be set in the "Dosing" menu.

### 6.4 Operating modes

Operating modes are selected via the "Operating modes" menu.

**"Manual" operating mode**

The stroke rate is set manually via the control unit.

**"Batch" operating mode**

This operating mode provides the option of working with large transfer factors (up to 65535). Metering can be triggered by pressing the button [P] or by a pulse received via the "External control" jack through a contact or a semiconductor switching element. A metering volume (batch) or a number of strokes can be selected in the "Settings" menu using the [arrow keys].

Operating mode "Contact"

This operating mode offers the option of activating the pump externally by means of potential-free contacts (e.g. by means of a contact water gauge). The number of strokes (reducing or transfer factor 0.01 to 99.99) can be pre-selected in the "Settings" menu using the [arrow keys].

**"Analog" operating mode**

The stroke rate is controlled using an analog current signal via the "External control" jack. Processing of the current signal can be pre-selected via the control unit.

### 6.5 Functions

The following functions can be selected via the menu "Settings":

**"Calibrate" function**

The stroke rate is controlled using an analog current signal via the "External control" jack. Processing of the current signal can be pre-selected via the control unit.

The pump can also be operated in the calibrated state in all operating modes. The corresponding continuous displays can then either display the metering volume or the capacity (in the 2nd level continuous display). The calibration remains valid over the entire stroke rate range and over a stroke length range from 0 - 100 %.
### Functional description

<table>
<thead>
<tr>
<th>Function Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>

#### 6.6 Relay (options)

The pump has several connection options for:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Fault indicating relay&quot; option</td>
<td>The relay can, in the event of fault or warming alerts or messages (e.g. &quot;Warning level&quot;), close a connected electric circuit (e.g. for an alarm horn). The relay can be retrofitted through a knock-out opening in the pump foot - refer to &quot;Retrofitting relays&quot;.</td>
</tr>
<tr>
<td>&quot;Fault indicating and pacing relay&quot; option</td>
<td>This combined relay can generate a contact with each stroke via its pacing relay in addition to its function as a fault indicating relay. The relay can be retrofitted through a knock-out opening in the pump foot - refer to &quot;Retrofitting relays&quot;.</td>
</tr>
<tr>
<td>&quot;mA output&quot; option</td>
<td>The I signal of the current output signals the currently calculated pump metering volume. The option &quot;mA output&quot; can be retrofitted via a knock-out in the control unit. The option additionally always provides a fault indicating relay or a pacing relay.</td>
</tr>
</tbody>
</table>
6.7 Functional and fault Indicator

The operating and fault statuses are indicated by the three LED indicators and the "Fault" identifier of the LCD screen, see also the "Troubleshooting" chapter.

6.8 LCD display

If a fault occurs, the identifier "Fault" appears as well an additional, explanatory symbol.

6.9 LED indicators

Fault indicator (red)

The fault indicator lights up if the liquid level in the chemical feed container falls below the second switching point of the level switch (20 mm residual filling level in the chemical feed container).

This LED flashes in the event of an undefined operating mode.

Warning indicator (yellow)

The warning indicator lights up if the fluid level in the chemical feed container falls below the first switching point of the level switch.

Operating indicator (green)

The operating indicator lights up if the pump is ready for operation and there are no fault or warning alerts. It goes out quickly as soon as the pump has performed a stroke. It starts to flash as soon as the stroke rate falls below 30 strokes / min.

6.10 Hierarchy of operating modes, functions and fault statuses

The different operating modes, functions and fault statuses have a different effect on if and how the pump reacts.

The following list shows the order:

1. - Priming
2. - Fault, Stop, Pause
3. - Auxiliary rate
4. - Manual, Analog, Contact, Batch

Comments:

re 1 - " Priming" can take place in any mode of the pump (providing it is functioning).

re 2 - "Fault", "Stop" and "Pause" stop everything apart from "Prim-ing".

re 3 - The stroke rate of "Auxiliary rate" always has priority over the stroke rate specified by an operating mode or priority 4.
7 Assembly

**WARNING!**
Risk of electric shock
If water or other electrically conducting liquids penetrate into the drive housing, an electric shock may occur.
- Position the pump so that drive housing cannot be flooded.

**CAUTION!**
Danger from incorrectly operated or inadequately maintained pumps
Danger can arise from a poorly accessible pump due to incorrect operation and poor maintenance.
- Ensure that the pump is accessible at all times.
- Adhere to the maintenance intervals.

**Capacity too low**
The liquid end valves can be disrupted by vibrations.
- Secure the metering pump so that no vibrations can occur.

**Capacity too low**
If the valves of the liquid end do not stand vertically upwards, they cannot close correctly.
- Suction and discharge valves must stand vertically upwards (for self-bleeding liquid end, the bleed valve).

Mount the metering pump with the pump foot on a horizontal, level and load-bearing supporting surface.
8 Hydraulic installation

Notes

CAUTION!
Small quantities of feed chemical can escape
Due to its design, small quantities of feed chemical escape at the piston. Therefore appropriate safety precautions must be taken if toxic media are being metered.

- If toxic feed chemicals are being metered, take appropriate safety precautions.
  Observe the safety data sheet for the feed chemical.

CAUTION!
Escaping feed chemical
If the vent screw is open, feed chemical escapes.

- As necessary, implement suitable protective measures.
- Observe the safety data sheet for the feed chemical.

CAUTION!
Warning of backflow
A back pressure valve or a spring-loaded injection valve do not represent absolutely leak-tight closing elements.

- For this purpose use a shut-off valve, a solenoid valve or a vacuum breaker.

Suction side installation

- Keep the suction line as short as possible.
- Route the suction line so that it has a constant upwards slope in order to prevent gas collecting in it.
- The pump cannot be primed against pressure. For this purpose, open the vent screw, provided the properties of the feed chemical permit. If they do not permit it, arrange the system accordingly.

Screwing the back pressure valve on to the discharge valve

1. First screw the valve on finger-tight.
2. Tighten the valve according to the following table.
Hydraulic installation

Installing PTFE hose on TT-liquid end

![Diagram of PTFE hose installation](P_DIE_8023_DIN)

**Fig. 7: Installing PTFE hose on TT-liquid end**

1. Push the screw fitting (2) and the slide ring (1) on to the PTFE hose (3).
2. Heat the edge pin (4) (within the scope of delivery) to approx. 60 ... 80 °C.
   - Do not kink the hose in the following step!
   - To press on, use e.g. anti-skid emery paper or similar.
3. Press the hose with the screw fitting and the slide ring onto the hot edge pin.

Installing PTFE hose on stainless steel liquid end

Max. operating pressure 6 bar for 1/8" and 1/16" PTFE hose, valid for connector system on pipe nipple with mikro delta®.

Plug the PTFE hose onto the pipe nipple.
Installing stainless steel pipe

![Diagram of stainless steel pipe installation]

Fig. 8: Installing stainless steel pipe

1. Stainless steel pipe 1/8" or 1/16"
2. Thrust collar 1/8" or 1/16"
3. Tensioning collar 1/8" or 1/16"
4. Connecting nut 1/8" or 1/16"

Preparation:

Remove the hose with the nipple from the liquid end.

1. Push the connecting nut, thrust collar and the tensioning collar onto the pipe.
2. Push the pipe end right into the hole.
3. Place the tensioning collar and the thrust collar on the connection.
4. Position the connecting nut and tighten.
9 Electrical installation

**WARNING!**

**Danger of electric shock**
A mains voltage may exist inside the device.

- Before any work, disconnect the device's mains cable from the mains.

**WARNING!**

**Risk of electric shock**
This pump is supplied with a grounding conductor and a grounding-type attachment plug.

- To reduce the risk of electric shock, ensure that it is connected only to a proper grounding-type receptacle.

**WARNING!**

**Risk of electric shock**
In the event of an electrical accident, the pump must be quickly disconnected from the mains.

- Install an emergency cut-off switch in the pump power supply line or
- Integrate the pump in the emergency cut-off management of the system and inform personnel of the isolating option.

**WARNING!**

**Danger of electric shock**
Incompletely installed electrical options can allow moisture into the inside of the housing.

- Knock-out openings in the pump housing must be equipped with matching modules or be sealed in a leak-tight manner.

**WARNING!**

**Danger of electric shock**
A mains voltage may exist inside the pump housing.

- If the pump housing has been damaged, you must disconnect it from the mains immediately. It may only be returned to service after an authorised repair.
CAUTION!
Risk of short circuiting caused by moist pins
No moisture must reach the pins of the PROFIBUS® jack.
- A suitable PROFIBUS® plug or protective cap must be screwed onto the PROFIBUS® jack.

CAUTION!
Material damage possible due to power surges
Should the pump be connected to the mains power supply in parallel to inductive consumers (such as solenoid valves, motors), inductive power surges can damage the controller when it is switched off.
- Provide the pump with its own contacts and supply with voltage via a contactor relay or relay.

Personnel: Electrician

Install the pump technically correctly and in accordance with the operating instructions and applicable regulations.

9.1 Supply voltage connector

WARNING!
Unexpected startup is possible
As soon as the pump is connected to the mains, the pump may start pumping and consequently feed chemical may escape.
- Prevent dangerous feed chemicals from escaping.
- If you have not successfully prevented this, immediately press the [STOP/START] key or disconnect the pump from mains, e.g. via an emergency cut-off switch.

CAUTION!
If the pump is integrated into a system: The system must be designed so that potential hazardous situations are avoided by pumps starting up automatically subsequent to unintended power interruptions.

Connect the pump to the mains power supply using the mains cable.
9.2 Description of the jacks

9.2.1 "External control" terminal

The "external control" jack is a five-pin panel jack. It is compatible with two- and four-conductor cables.

The "Auxiliary frequency" and "mA-output" functions can only be used with a five conductor cable.

Electrical interface for pin 1 "Pause" - pin 2 "External contact" - pin 5 "Auxiliary frequency"

</tbody>
</table>

* with identity code characteristic "Control version": 3, 5 and R

Refer to the functional description for the hierarchy of functions and operating modes.

"Pause" function

The pump does not work if:
- the cable is connected and pin 1 and pin 4 are open.
The pump works if:
- the cable is connected and pin 1 and pin 4 are connected.
- no cable is connected.

"External contact" operating mode

The pump performs one or more strokes if:
- Pin 2 and pin 4 are connected to each other for at least 20 ms.
  At the same time, pin 1 and pin 4 must also be connected to each other.

"Auxiliary frequency" operating mode

The pump works at a preset stroke rate if:
- Pin 5 and pin 4 are connected to each other. At the same time, pin 1 and pin 4 must also be connected to each other. The auxiliary frequency is factory-preset to the maximum stroke rate.

9.2.2 "Level Switch" terminal

There is a connecting option for a 2-stage level switch with pre-warning and limit stop.

Electrical interface

Fig. 11: Pump pin assignments

9.2.3 "Dosing monitor" terminal

There is a connecting option for a dosing monitor.

Electrical interface
### 9.3 Relay

#### 9.3.1 "Fault indicating relay" output (identity code 1 + 3 or 4 + 5)

A fault indicating relay can be ordered as an option - refer to ordering information in the appendix. It is used to emit a signal when there is a fault with the pump and with "Liquid level low, 1st stage" warning alert and "Liquid level low 2nd stage" fault alert.

A cut-off relay works when there are fault alerts from the pump and in the event of the "Liquid level low 2nd stage" fault alert.

The fault indicating relay can be retrofitted and is operational once attached to the relay board - refer to "Retrofitting Relays" in the Appendix.

9.3.2 Output pacer relay (identity code 4 + 5)

A fault indicating and a pacing relay can optionally be ordered - refer to ordering information in the appendix. The pacing output is electrically-isolated by means of an optocoupler with a semiconductor switch. The second switch is a relay.

The fault indicating/pacing relay can be retrofitted and is operational once attached to the relay board - refer to "Retrofitting Relays" in the Appendix.

10 Adjustment

10.1 Basic principles of control adjustment

Quickly press key [P].

The display simultaneously changes to the next selection, to the next menu point or into a continuous display.

Press the [UP] key in the top menu selection, if no entry has been started (flashing beam).

You will jump back to the previous menu point or menu, at most back to the main menu.

Press and hold the [P] key for 3 seconds.

Entry is cancelled and you jump back to a continuous display.

Press the arrow keys [UP] or [DOWN].

In this way the number between the flashing bars counts upwards or downwards.

Under "Changing a number": press key [P] 1x.

The display simultaneously changes to the next selection, to the next menu point or into a continuous display.

10.2 Checking adjustable variables

Continuous displays

Before you adjust the pump, you can check the actual settings of the adjustable variables:

- Please read the overviews in the appendix, "Control elements and key functions" and "Operating/setting diagram" for supplementary information.
- If no key is pressed for a 1 minute duration, the pump returns to a continuous display.
Press the key [i] ("i" for "Info"), if the pump is displaying a continuous display (The display does not contain the symbol for the [P] key).

Each time you press the [i] key, you see another continuous display, an "i" can be seen at the top left.

The number of continuous displays depends on the identity code, the selected operating mode and the connected additional devices, see overview "Continuous displays" in the appendix.

Secondary displays
The lowest line of the Info displays (2nd level continuous display) various information, which cannot, however, be adjusted here, see overview "Secondary displays" in the appendix...

If you are in a continuous display, you can access the bottom line of the info displays by:

1. pressing key [i], provided that the top left double arrow is not visible.
2. Keep key [i] pressed down until a small arrow appears and glides into the bottom line of the LCD display.
3. As soon as it has reached it, quickly release the [i] key and immediately page through the info displays in the bottom line by quickly pressing the [i] key.

10.3 Changing to adjustment mode
If the [P] key is pressed for 2 seconds in a continuous display, the pump changes to adjustment mode. If [Lock menu] or “Lock all” have been set under “Security” (top left lock symbol), the [P] key must be pressed and then the access code entered ([arrow keys]).

The following menus can be initially chosen in adjustment mode - see also the overview "Operating/setting diagram":
- Menu “Operation”
- Menu “Settings”
- Menu “Security” (option)
- Menu “Delete”
- Menu “Language”

To adapt the pump to your process requirements, you must:

1. Select the operating mode in the “Operation” menu.
2. Carry out the adjustment for this operating mode under the “Settings” menu.
10.4 Selecting the operating mode (Menu "Operation")

In the "Operation" menu (dependent on the identity code, some operating modes may not be present) the following operating modes can be selected:

- "Manual": for manual operation
- "Batch": for batch operation
- "Contact": for contact operation
- "Analog": for current control

10.5 Operating mode settings (menu "Settings")

Various settings can be adjusted in the "Settings" menu dependent on the selected operating mode.

Setting menus are available in all operating modes for the following programmable functions:

- "Auxiliary rate"
- "Calibration"
“Metering”
“System”

For further details, see Chapter 10.6 “Programmable function settings ("Settings" menu)” on page 46

As to whether or not a further setting menu is available, depends on the selected operating mode and the connected devices or modules.

10.5.1 "Manual" operating mode settings

Alongside the setting menu, which are described in more detail in Chapter 10.6 “Programmable function settings ("Settings" menu)” on page 46, in "Manual" operating mode in the "Settings" menu there is no further setting menu available.
10.5.2 Settings for the “Batch” operating mode (BATCH menu)

Alongside the setting menus, which are described in more detail in Chapter 10.6 “Programmable function settings (“Settings” menu)” on page 46, in “Batch” operating mode in the “Settings” menu, the “BATCH” menu is also available.

The operating mode “Batch” is one variant of the “Contact” operating mode - see the following chapter. Here also, you can select a number of strokes (no fractions, only integers from 1 to 65535).

Operating mode “Batch” is intended for large metering quantities.

Metering can be triggered by pressing the [P] key or via an pulse received via the “External Control” jack.

The number of received pulses, which could not yet be processed, is stored by the pump in the stroke memory.

CAUTION!

When changing over from the “Manual” operating mode to the “Batch” operating mode, the pump maintains the stroke rate.

The stroke rate can also be set in “Contact” operating mode. It should normally be set to 100 strokes / min.

In operation, the batch size can be changed more easily by using “Batch size” in the continuous display:

1. Using the [i] key, select the “Batch size” continuous display (displays an “↑L” after the number).
2. Hold down an [arrow key] until the variable is flanked by two flashing bars.
3. Change the batch size as required using the [arrow keys].

“Memory” function extension

Additionally, you can activate the “Memory” function extension (Identifier “m”). When “Memory” is activated, the pump adds up the remaining strokes, which could not be processed, up to the maximum capacity of the stroke memory of 65,535 strokes. If this maximum capacity is exceeded, the pump goes into fault mode.
10.5.3 "Contact" operating mode settings

Alongside the setting menus, which are described in more detail in Chapter 10.6 “Programmable function settings ("Settings" menu)” on page 46, in “Contact” operating mode in the “Settings” menu, the “Contact” menu is also available.

“Contact” operating mode allows you to trigger individual strokes or a stroke series.

You can trigger the strokes via a pulse sent via the "External control" jack.

The purpose of this operating mode is to convert the incoming pulses with a reduction (bridge) or small step-up into strokes.

**CAUTION!**

When changing over from “Manual” operating mode to “Contact” operating mode, the pump maintains the stroke rate.

The stroke rate can also be set in “Contact” operating mode. It should normally be set to 100 strokes / min.

The number of strokes per pulse depends on the factor which you input. By use of the factor you can multiply incoming pulses by a factor between 1.01 and 99.99 or reduce them by a factor of 0.01 to 0.99.

Number of strokes executed = factor x number of incoming pulses

</tbody>
</table>

* **Explanation of the conversion ratio**

With a factor of 1, ... 1 stroke is executed per 1 pulse.
With a factor of 2, ... 2 strokes are executed per 1 pulse.
With a factor of 25, ... 25 strokes are executed per 1 pulse.

** **Explanation of reduction**

With a factor of 1, ... 1 stroke is executed per 1 pulse.
With a factor of 0.5, ... 1 stroke is executed after 2 pulses.
With a factor of 0.1, ... 1 stroke is executed after 10 pulses.
With a factor of 0.75, ... 1 stroke is executed once after 2 pulses, then 1 stroke is executed after 1 pulse two times, and then again 1 stroke after 2 pulses etc.
If a remainder is obtained when dividing by the factor, then the device adds the remainders together. As soon as this sum reaches or exceeds “1”, the pump executes an additional stroke. Therefore on average during the metering operation, the resultant number of strokes precisely matches the factor.

Non-processed pulses
The number of received pulses, which could not yet be processed, is stored by the pump in the stroke memory. When the [STOP/START] key is pressed or the “Pause” function is activated, the stroke memory is deleted. You can avoid this with the “Memory” function extension:

“Memory” function extension
Additionally, you can activate the “Memory” function extension (Identifier “m”). When “Memory” is activated, the pump adds up the remaining strokes, which could not be processed, up to the maximum capacity of the stroke memory of 65,535 strokes. If this maximum capacity is exceeded, the pump goes into fault mode.

Contact water meter
With "Pulse control" you can optimally adapt the pump to the relevant process, for example in conjunction with contact water meters.

10.5.4 "Analog" operating mode settings
Alongside the setting menus, which are described in more detail in Chapter 10.6 “Programmable function settings (“Settings” menu)” on page 46, in “Analog” operating mode in the “Settings” menu, the “ANALOG” menu is also available. The stroke rate is controlled using an analog current signal via the “External control” jack. The continuous display "Signal current" of the 2nd level indicates the incoming current.

You can select three types of current signal processing:
- “0 - 20 mA”
- “4 - 20 mA”
- “Curve”

0 - 20 mA
At 0 mA the pump is stationary -
At 20 mA the pump works at the maximum stroke rate.
Between these values, the stroke rate is proportional to the current signal.
At 4 mA the pump is stationary -
At 20 mA the pump works at the maximum stroke rate.
Between these values, the stroke rate is proportional to the current signal.
For current signals less than 3.8 mA a fault message appears and the pump stops (e.g. if a cable has broken).

**The maximum stroke rate can only be reduced under processing type “Curve”, not under processing types “0 .. 20” and “4 .. 20”.

**Curve**
In the processing type “Curve” you can freely program the pump behaviour.
There are three options:
- Linear
- Lower sideband
- Upper sideband

**The following applies to all three options:**
The smallest processable difference between I1 and I2 is 4 mA (|I1-I2| ≥ 4 mA).

**Linear**
The "Linear" symbol appears in the LCD display. You can enter any stroke rate-behaviour of the pump proportional to the current signal. For this purpose, enter any two points P1 \((I_1, F_1)\) and P2 \((I_2, F_2)\) (\(F_1\) is the stroke rate at which the pump is to operate at current \(I_1\), \(F_2\) is the stroke rate at which the pump is to operate at current \(I_2\)...); this defines a straight line and thus the behaviour is specified:

\[
\begin{array}{c}
\text{I [mA]} \\
\hline
0 & I_1 & I_2 & 20 \\
\end{array}
\]

\[
\begin{array}{c}
\text{F} \\
\hline
F_1 & F_2 & F \text{ max} \\
\end{array}
\]

Fig. 21: Rate(frequency)-Current Diagram for Linear control

Plot a diagram similar to the one above - with values for \((I_1, F_1)\) and \((I_2, F_2)\) – so that you can set the pump as desired!

Fault processing

Under the menu option “Alarm message” (fault) your can activate a fault processing sequence for the “Curve” processing type. For current signals below 3.8 mA, a fault message appears and the pump stops.

Lower sideband

Using this processing type, you can control a metering pump using the current signal as shown in the diagram below.

The "Lower sideband" symbol appears in the LCD display. Below \(I_1\), the pump works at a rate of \(F_1\) - above \(I_2\) it stops. Between \(I_1\) and \(I_2\) the stroke rate varies between \(F_1\) and \(F_2\) in proportion to the signal current.

Fig. 22: Frequency-current diagram for a) Lower sideband, b) Upper sideband
Using this processing type, you can control a metering pump using the current signal as shown in the diagram above.

The "Upper sideband" symbol appears in the LCD display. Below I1, the pump is stationary - above I2 the pump works at rate F2. Between I1 and I2 the stroke rate varies between F1 and F2 in proportion to the signal current.

10.6 Programmable function settings ("Settings" menu)

Setting menus are available in all operating modes in the menu "SETTINGS" for the following programmable functions:

- Auxiliary rate (menu “AUX”)  
- Flow (menu “FLOW”) (only available if a dosing monitor is connected)  
- Calibrate (menu “CALIBRATE”)  
- Metering (menu “METERING”)  
- Relay (menu “RELAY”) (only available if a relay is fitted)  
- System (menu “SYSTEM”)

10.6.1 Settings for the “Auxiliary rate” function (AUX menu)

The programmable function " Auxiliary rate" facilitates the switch-over to an auxiliary stroke rate, which can be fixed in the "AUX" menu. It can be activated via the "External control" jack. If the auxiliary rate applies, then the identifier "Aux" appears in the LCD display.

This auxiliary rate has priority over the stroke rate, which is specified by the currently selected operating mode - see also the chapter "Function description" - "Hierarchy of operating modes".

10.6.2 Settings for the “Flow” function (FLOW menu)

The menu "FLOW" only appears if a dosing monitor is connected to the "Dosing monitor" jack. The dosing monitor records the individual pressure surges of the pump at the discharge connector during pulsed metering ("Metering" “fast”, menu "METERING") and immediately reports it back to the pump. In the event that this feedback message remains missing in a sequence as often as set in the menu "FLOW" under "Tolerance" (due to a failure or too low a metering level), then this function stops the pump. The last menu option provides the choice, of whether this case should lead to a "Fault" or a "Warning".
The function “Flow” can be deactivated for the “AUX” operating mode (auxiliary rate).

10.6.3 Settings for the “Calibrate” function (CALIBRATE menu)

The pump can also be operated in the calibrated state. In this case, the corresponding continuous displays then indicate the metering volume or the capacity directly.

**Accuracy of the calibration**

The calibration will not be accurate, if these conditions are not adhered to:
- do not allow the stroke length to fall below 10 %
- The pump should execute at least 100 strokes.

**WARNING!**

If the feed chemical is dangerous, take appropriate safety precautions when executing the following calibration instructions. Observe the safety data sheet for the feed chemical!

Scales may be better for measuring the metering volume than the measuring cylinder suggested below. This depends on the metering quantities, which must be measured.

1. Lead the suction hose into a measuring cylinder containing the feed chemical - the discharge hose must be installed in a permanent manner (operating pressure, ...!).
2. Prime using the feed chemical (simultaneously press the two [arrow keys]), should the suction hose be empty.
3. Record the level in the measuring cylinder.
4. Using the [i] key scroll through the continuous display and check whether litres or gallons are selected.

5. If the incorrect volume units are selected, select the "SYSTEM" menu and then the "UNITS" sub-menu.

6. Using the [arrow keys], select the correct units and confirm by pressing the [P] key.

7. Select the "CALIBRATE" menu and then use the [P] key to change to the first menu option.

8. Use the [DOWN] key to select "Start calib."

9. To start the calibration, press the [P] key: The next menu option, "Stop calib.", appears, the pump starts to pump and indicates the stroke rate (the pump works at the stroke rate, which is set under "MANUAL").

10. After a reasonable number of strokes (e.g. 100), stop the pump by pressing the [P] key.

11. Determine the required metering volume (difference initial volume - residual volume).

12. Enter this volume in the menu option which appears and then press the key [P] - the pump changes to continuous display.

   The pump is calibrated.

   The corresponding continuous displays indicate the calibrated values.

10.6.4 Settings for the "Metering" function (DOsing menu)

10.6.4.1 Settings in the sub-menu "Settings" (metering)

In the sub-menu "Settings" (metering), you can precisely match the pump metering flow over time against the requirements of the particular application.

Discharge stroke

Hence the user can, dependent on requirements, set a fast discharge stroke ("Metering" - "fast") for pulsed metering e.g. for quick clocked filling processes (a) or a slow discharge stroke ("Metering" - "slow") for quasi-continuous metering, e.g. for processes requiring good mixing (b).
Fig. 23

- During quasi-continuous metering for high accuracy set as large as possible a stroke length.
- The slowing of the discharge stroke only becomes noticeable at lower stroke rates.
- At maximum stroke rate, “slow” is identical to “fast”!
- Slowing of the suction stroke leads to a lower capacity.

**Suction stroke**

In both metering modes it is possible, to selectively also slow the suction stroke. For the case of volatile feed chemicals, the slow suction stroke prevents cavitation and consequently increases metering precision (b) and (c)). In this way, it is possible to prevent the main cause for imprecise metering with high viscosity feed chemicals, namely the incomplete filling of the liquid end.

**Fig. 24: Pulsed and quasi-continuous Mode with:**

a) normal suction stroke  
b) slightly slowed suction stroke  
c) maximally slowed suction stroke
The metering behaviour of the pump can be matched to the viscosity of the feed chemical.

<table>
<thead>
<tr>
<th>Viscosity in mPa</th>
<th>&quot;Dosing&quot; setting</th>
<th>Suction stroke slowing</th>
<th>Max. stroke rate</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>0...50</td>

</tr>
<tr>
<td>500...1000</td>
<td>&quot;HV3&quot;</td>
<td>Maximum</td>
<td>25</td>
<td>for valves with springs</td>
</tr>
</tbody>
</table>

The viscosities were measured using silicone oil (Newtonian liquids) with a 0.5 m suction line.

For the adjustment for slowing the suction stroke dependent upon the feed chemical viscosity - see the "Adjustment" chapter.

### 10.6.5 Settings for the "Relay" function (RELAY menu)

Using the "Relay" programmable function, you can match the pump relays to your requirements.
You can reprogram the relays using the "Relay" function in an almost limited way. Exception: The two 8 A fault indicating relays (under identity code: 1 and 2) and the 8 A cut-off relays (under identity code: 6 and 7) can only be reprogrammed from “NO” to “NC” and vice versa.

### Allocations for the relay combinations

<table>
<thead>
<tr>
<th>Identity code specification</th>
<th>Relay type</th>
<th>&quot;Relay 1&quot;</th>
<th>&quot;Relay 2&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(Mechanical relay)</td>
<td>Semiconductor relay)</td>
<td></td>
</tr>
<tr>
<td>4 + 5</td>
<td>Fault indicating relay and pacing relay</td>
<td>Fault indicating relay</td>
<td>Pacing relay</td>
</tr>
<tr>
<td>8 + 9</td>
<td>Cut-off relay and pacing relay</td>
<td>Cut-off relay</td>
<td>Pacing relay</td>
</tr>
<tr>
<td>A + B</td>
<td>Cut-off relay and warning relay</td>
<td>Cut-off relay</td>
<td>Warning relay</td>
</tr>
</tbody>
</table>

You can set whether the respective relay is to switch due to a triggering event from the timer, upon a warning alert, a fault alert or a pump stroke:

### Selectable behaviour types

<table>
<thead>
<tr>
<th>Setting in the &quot;Relay&quot; menu</th>
<th>Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning</td>
<td>The relay switches upon a warning alert (yellow LED*).</td>
</tr>
<tr>
<td>Fault</td>
<td>The relay switches upon a fault alert (red LED*).</td>
</tr>
<tr>
<td>Warning + fault</td>
<td>The relay switches upon a warning alert (yellow LED*) or a fault alert (red LED*).</td>
</tr>
<tr>
<td>Pacing relay</td>
<td>The relay switches every stroke.</td>
</tr>
<tr>
<td>Option</td>
<td>The relay has the option of which module was plugged in (e.g. timer).</td>
</tr>
<tr>
<td>Warn. + Fault + Stop</td>
<td>The relay switches upon a warning alert (yellow LED*) or a fault alert (red LED*) or a stop (key &quot;STOP/START&quot; or pause).</td>
</tr>
</tbody>
</table>

* see "Troubleshooting" chapter

You can also indicate how the respective relay should behave as soon as it switches. You can change this via the setting "NO" / "NC."

The setting option for the "Relay" function only exists if a relay is present.
The following table summarises once more the behaviour of the deliverable relay types according to the identity code in the as-delivered condition:

**Relay type behaviour according to identity code**

<table>
<thead>
<tr>
<th>Relay type</th>
<th>Behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warning indicating relay</td>
<td>... switches upon a warning alert (yellow LED*).</td>
</tr>
<tr>
<td>Fault indicating relay</td>
<td>... switches upon a warning alert (yellow LED*) and / or a fault alert</td>
</tr>
<tr>
<td></td>
<td>(red LED*).</td>
</tr>
<tr>
<td>Cut-off relay</td>
<td>... switches upon a fault alert (red LED*).</td>
</tr>
<tr>
<td>Pacing relay</td>
<td>... switches with every pump stroke.</td>
</tr>
</tbody>
</table>

* see "Troubleshooting" chapter

10.6.6 Settings for the “Analog output” function (ANALOG OUTPUT menu)

Using the “Analog output” programmable function, you can match the pump current output signal to your requirements.

The signal I of the current output signal one of the three following variables:

- Strokes /h
- mL / h x stroke length (= current, calculated capacity)
- Performance (= capacity, value adjustable at 20 mA)

In the "Stop" or "Pause" states (either because of a fault or operation) or "Pause" the current output emits a current of 4 mA.

The signal for the current, calculated capacity "mL / h " is calculated by the pump according to the following formula (here for the range 4-20 mA):

\[ I(4...20) = 16 \times (f/f_{\text{max}}) \times (L/100) + 4 \]

with
I - Output current in mA
f - Stroke rate in strokes/min
L - Stroke length in %
\( f_{\text{max}} \) - Maximum stroke rate in strokes/min

In the “Contact” and “Batch” operating modes, \( f \) is the stroke rate which is set in the "Stroke rate" continuous display.

10.6.7 Settings in the "System" menu" (SYSTEM menu)

The "System" menu branches into the following sub-menus:
- Info
- Change head?

10.6.7.1 "Info" sub-menu

In the "Info" sub-menu you can read off the following identification numbers:
- Identity code ID
- Serial number SN
- Software control SW
- Hardware control HW
- Software drive AS
- Hardware drive AH
- Name module-option (e.g. proTIME)
- Software option OS
- Hardware option OH

10.6.7.2 Sub-menu "Change head?"

CAUTION!
- Should a different liquid end size be fitted, then the pump must be reprogrammed in the sub-menu “Change head?”.
- For demonstration purposes or if operating without feed chemical, reprogram the pump to “Without head”.

ProMinent®
10.7 Set code (SECURITY menu)

In the “SECURITY” menu, you can enter whether you want to block sections of the adjustment options.

In the first menu option, you can either set “None” or “Lock menu” or “Lock all” (both locks use the same code):

- Select “None”, to clear a security lock.
- Select “Lock menu” to lock the adjustment mode (point ① in the overview "Operating/setting diagram", in the appendix). In the next menu option, enter the number you want to use as the code.
- Select “Lock all” to lock the adjustment option for the directly adjustable variables in the continuous displays and to lock the stroke length (point ② in the overview "Operating/setting diagram", in the appendix), in addition to the adjustment mode. In the next menu option, enter the number you want to use as the code.

If a lock is set, a padlock appears in the continuous display.

If you have set “Lock all”, a padlock will appear after 1 minute in the top left corner and the specified areas are locked, if no key has been pressed in the meantime.

If you have set “Lock menu”, the operating menu will be locked after 1 minute, if no key has been pressed in the meantime.

Test

To test whether the menu is locked, press the [P] key for 2 s.

If you try to change into a locked area, a key appears in the LCD display and the padlock flashes.

Overriding the lock

To override the lock, enter the code using the [arrow keys].

Changing the stroke length variable

In the stroke adjustment dial has been turned, the padlock flashes, the pump stops and a fault alert and key appear. If you enter the code, the pump continues metering and the fault alert clears.
10.8 Delete total number of strokes or total litres (CLEAR menu)

In the “DELETE” menu, you can either delete the stored total number of strokes or the total litres or both together (= reset to "0"):

- “None”
- “Counter” (total number of strokes)
- “Quantity” (total litres)
- “all” (both)

To do this quit the menu by quickly pressing the key [P] key.

The variables have increased since commissioning of the pump, the last calibration or the last deletion.

10.9 Set language (LANGUAGE menu)

In the “LANGUAGE” menu, you can select the desired operating language.

The selection “English (US)” also changes the decimal comma to a decimal point in the displays.
11 Operation

**WARNING!**
Warning of crushing of the fingers
The moving parts in the turrent can crush fingers.
- The protective bush on the liquid end must always be closed when the pump is ready for operation.

**CAUTION!**
If the vent screw is open, feed chemical escapes.
- As necessary, implement suitable protective measures.
- Adhere to the safety data sheet for the feed chemical.

**WARNING!**
Danger of electric shock
Incompletely installed electrical options can allow moisture into the inside of the housing.
- Knock-out openings in the pump housing must be equipped with matching modules or be sealed in a leak-tight manner.

**WARNING!**
Danger of electric shock
A mains voltage may exist inside the pump housing.
- If the pump housing has been damaged, you must disconnect it from the mains immediately. It may only be returned to service after an authorised repair.

This chapter describes all the operating options available to you if the pump is displaying a continuous display - the display does not contain the symbol for the [P] key.

- For supplementary information, see the overviews "Control elements and key functions" in the chapter "Device overview and control elements" and "Operating/setting diagram" in the appendix.
- Also take note of the overview "Continuous displays" in the appendix. It shows which continuous displays are available in which operating mode and which variables are directly changeable in the relevant continuous display.
11.1 Manual

Personnel: □ Instructed personnel

Adjusting the stroke length

The pump may demonstrate unexpected behaviour during operation.

– Do not set the stroke length adjustment knob to more than 100 %.

The stroke length is adjusted by the stroke length adjustment knob within a range of 0 ... 100 %. A stroke length of between 4 ... 100 %) is recommended to achieve the specified reproducibility.

The following image shows the settings for two stroke length values on the fine stroke length adjustment knob and the use of the locking lever.

![Image showing stroke length adjustment settings](image.png)

Fig. 25: Adjustment examples for stroke length values: 0.00 %, 33.0 %, 33.2 % and 100.0 %. Locking lever in position A: stroke length adjustment knob free; locking lever in position B: Stroke length adjustment knob locked.

100 % corresponds to 5 mm stroke length corresponds to 10 rotations

Calculation example

A stroke length of 2 mm is to be set.

I.e.: 2 mm x (100% / 5 mm) = 2 mm x (20% / 1 mm) = 40 %

The following operating options are available via the keys - see the next figure:
### Operation

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Stop/start pump**              | Stop the pump: Press the [STOP/START] key.  
Start the pump: press the [STOP/START] key again.                                                                                     |
| **Start batch**                  | In “Batch” operating mode: briefly press key [P].                                                                                       |
| **Changing to adjustment mode**  | If the [P] key is pressed for 2 seconds in a continuous display, the delta® changes to adjustment mode - see chapter “Adjustment”.  
If an access code was set in the “Security” menu for “Lock menu”, then after pressing the [P] key the access code must first be entered. |
| **Checking adjustable variables**| After every press of the [i] key, a different continuous display is shown. The number of continuous displays depends on the identity code, the selected operating mode and the connected additional devices. |
| **Changing directly changeable variables** | To change a variable, see below, directly in the corresponding continuous display, press and hold one of the [arrow keys] (approx. 1/2 s) until the identifier “Double arrow” appears and the variable is flanked by two flashing lines. The delay has been programmed in to prevent variables from being unintentionally changed.  
If an access code was set in the "Security" menu for “Lock all”, then after pressing the [P] key the access code must first be entered. |
| **stroke rate**                  | In operating modes “Manual”, “Contact” and “Batch”:  
You can change the stroke rate in the "Stroke rate" continuous display.                                                                      |
| **Capacity**                     | In “Manual” operating mode:  
You can change the capacity in the "Capacity" continuous display.                                                                               |
| **Factor**                       | The factor is the number of strokes which are triggered upon an external pulse or by pressing key [P] (only in “Batch” operating mode.          |
| **Priming**                      | Simultaneous pressing of the two [arrow keys] triggers the "Priming" function (in the "Stroke rate" continuous display).                      |
Fault acknowledgement

Fault displays are acknowledged by brief pressing of the [P] key.

---

Fig. 26: Operating options with a locked operating menu

11.2 Remote operation

There is an option to control the pump remotely via a signal cable - refer to your system documentation and to the "Electrical Installation" chapter.
WARNING!
It is mandatory that you read the safety information and specifications in the "Storage, Transport and Unpacking" chapter prior to shipping the pump.

CAUTION!
Warning of feed chemical spraying around
Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.
- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

Standard liquid ends:

Under heavy loading (e.g. continuous operation): Shorter intervals.
Fig. 27: Leakage hole
13 Overhaul

Safety information

**WARNING!**

**Danger of an electric shock**
Unauthorised repairs inside the pump can result in an electric shock.

For this reason repairs inside the pump may only be performed by a ProMinent subsidiary or representative, in particular the following:
- Replacement of damaged mains connection lines
- Replacement of fuses
- Replacement of electronic control

**WARNING!**

It is mandatory that you read the safety information and specifications in the "Storage, Transport and Unpacking" chapter prior to shipping the pump.

**WARNING!**

**Contact with the feed chemical**
Parts that come into contact with the feed chemical are uncovered and handled during overhaul work.
- Protect yourself from the feed chemical should it be hazardous. Read the safety data sheet on the feed chemical.

**CAUTION!**

**Warning of feed chemical spraying around**
Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.
- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

13.1 Cleaning valves

- The exploded views in the Appendix should be referred to when working on the unit.
- Clean all parts with a suitable cleaning agent (without grinding or scouring particles).
Take off the liquid end from the drive

The liquid end may only be mounted later, after the valves have been screwed in. Otherwise the connecting point between the liquid end and valve may subsequently become untight. To do this, the liquid end must first be removed from the drive.

Personnel:  
- Technical personnel

Take off the liquid end - Chapter 13.2 “Replacing liquid end parts” on page 65

Cleaning a back pressure valve

1. Unscrew the back pressure valve in a counterclockwise direction from the discharge valve.

WARNING!
Danger of eye injuries
The back pressure valve contains a pretensioned compression spring.
- Wear safety glasses when dismantling.

Dismantle the valve inserts of the valves one after each other, so that you do not confuse the parts.

2. Guide a thin flat pin or similar into the smaller hole of the discharge connector and push the valve inserts out of it.

3. Inspect all parts for damage before assembling.

4. After cleaning the valve, first screw it on finger-tight.

5. Tighten the valve according to the following table.

<table>
<thead>
<tr>
<th>Material version</th>
<th>Tightening instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>TT_</td>
<td>approx. 30 ... 45°</td>
</tr>
<tr>
<td>SS_</td>
<td>approx. 45° or approx. 8 Nm</td>
</tr>
</tbody>
</table>

Cleaning a discharge valve

- Discharge and suction valves differ from each other! Only take them apart one after each other, so that you do not confuse the components!
- Only use new components which fit your valve - both in terms of shape and chemical resistance!
- Readjust the pump after replacing a valve!

1. Inspect all parts for damage before assembling.

2. After cleaning the valve, first screw it on finger-tight.

3. Tighten the valve according to the following table.
## Cleaning a suction valve

A suction valve is constructed in almost the same way as a discharge valve.

Please note, however, that:

- the two valve inserts are identical here
- there are a few flat seals in the dosing head and valves, which may possibly have to be renewed.
- The flow direction of the suction connector is the opposite of that of the discharge connector.

1. Inspect all parts for damage before assembling.
2. After cleaning the valve, first screw it on finger-tight.
3. Tighten the valve according to the following table.

<table>
<thead>
<tr>
<th>Material version</th>
<th>Tightening instruction</th>
</tr>
</thead>
<tbody>
<tr>
<td>TT_</td>
<td>approx. 30 ... 45°</td>
</tr>
<tr>
<td>SS_</td>
<td>approx. 45° or approx. 9 ... 10 Nm</td>
</tr>
</tbody>
</table>

*With new seals tighten the valves approx. 90 ... 120°.*
13.2 Replacing liquid end parts

Personnel: ● Technical personnel

Dismantling the dosing head

- If necessary, use protective equipment.
- Disconnect the pump from the mains power supply and secure to prevent switching on again.
- Depressurise the system.

1. Empty the liquid end: Unscrew the back pressure valve from the discharge valve starting slowly (to release the pressure). Place the liquid end on its head and allow the feed chemical to run out; flush out with a suitable medium; flush the liquid end thoroughly when using hazardous feed chemicals!

Fig. 28

2. ① Turn the stroke adjustment knob until it can go no further with 0 % stroke length if the pump is running (the drive axle is then blocked).

3. Switch off the pump.

4. Unscrew the hydraulic connectors on the discharge and suction side.

5. ② Push the protective bush (10) over the piston coupling in a forwards direction.

6. Insert a thin pin (screwdriver, Alley key) into the hole in the grooved coupling disc (7).

7. ③ Uncouple the piston by pressing it against the pump and turning the coupling disc (7) to the left (bayonet connection).
8. ④ Remove the forward knurled screws (1) from the dosing head.

9. ⑤ Take the dosing head (2) with piston (1) off from the pump.

Fitting of packing and piston

1  V-sleeve set
2  Pressure plate
3  Shim
4  Disc springs
5  Friction washer
6  Screws
7  Piston

TTT, TTG: SST, SSG:

Fig. 30: Arrangement and dimension "A" for the disc springs
1. Insert the V sleeve set (1) with forward opening in the dosing head.

2. Position the pressure plate (2).

3. Check dimension "A", if necessary insert the shim (3).

   **Dimension "A" - in mm**

<table>
<thead>
<tr>
<th>Type</th>
<th>A</th>
</tr>
</thead>
<tbody>
<tr>
<td>100150</td>
<td>3.0</td>
</tr>
<tr>
<td>100600</td>
<td>3.3</td>
</tr>
<tr>
<td>101500</td>
<td>3.3</td>
</tr>
<tr>
<td>600150</td>
<td>4.0</td>
</tr>
<tr>
<td>400600</td>
<td>3.8</td>
</tr>
<tr>
<td>201500</td>
<td>3.3</td>
</tr>
</tbody>
</table>

4. Precisely observe the arrangement of the disc springs.

   Insert the disc springs (4) precisely as shown.

5. Position the friction washer (5).

6. Screw the screws (6) in by hand - do not overtighten!

7. Carefully insert the piston (7).

   **If the liquid end is to be stored, this is the correct condition.**

8. Screw the screws (6) on to the friction washer (5) with the piston (7) inserted. Tighten in a diagonal pattern until the stop is reached.

   ⇒ Now the liquid end is ready for use.

   **The piston should not be pulled out of the dosing head once the friction washer is tightened.**

   **Should this occur however, the screws (5) must first be loosened before the piston can be pushed into the dosing head.**
**Fitted dosing head**

![Diagram](image)

**Fig. 31**

1. Carefully pull the piston (7) out far enough, so that the coupling disc (8) with its longitudinal holes can project over the heads of the coupling screws (11).

2. Push on the dosing head.

3. Tighten the knurled screws (9).

   ⇒ The liquid end is now secured.

**Piston fracture risk**

*Do not tilt the piston in the step described here.*

4. Snap the coupling disc (8) on to the coupling screws (11) by pressing against the pump and turning to the right over the inserted pin (bayonet connection).

5. Check the pump operation.

6. Push the protective bush (10) backwards over the piston coupling.
### 14 Troubleshooting

#### Safety Information

**WARNING!**
**Warning of hazardous or unknown feed chemical**
Should a hazardous or unknown feed chemical be used, it may escape from the hydraulic components when working on the pump.
- Take appropriate protective measures before working on the pump (protective eyewear, protective gloves,...). Read the safety data sheet on the feed chemical.
- Drain and flush the liquid end before working on the pump.

**CAUTION!**
**Warning of feed chemical spraying around**
Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.
- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

#### 14.1 Faults without a fault alert

<th>Personnel</th>
</tr>
</thead>
<tbody>
<tr>
<td>The yellow LED indicator illuminates, the &quot;Level&quot; symbol [\text{\textdagger}] appears flashing in the LCD display.</td>
<td>The liquid level in the storage tank has reached &quot;liquid level low 1st stage&quot;.</td>
<td>Fill the storage tank</td>
<td>Instructed personnel</td>
</tr>
</tbody>
</table>

### 14.5 All Other Faults

Please contact the responsible ProMinent subsidiary or representative!
**Decommissioning**

**WARNING!**

**Danger from chemical residues**

There is normally chemical residue in the liquid end and on the housing after operation. This chemical residue could be hazardous to people.

- It is mandatory that the safety information relating to the "Storage, transport and unpacking" chapter is read before shipping or transporting the unit.
- Thoroughly clean the liquid end and the housing of chemicals and dirt. Adhere to the safety data sheet for the feed chemical.

**WARNING!**

**Warning of hazardous or unknown feed chemical**

Should a hazardous or unknown feed chemical be used, it may escape from the hydraulic components when working on the pump.

- Take appropriate protective measures before working on the pump (protective eyewear, protective gloves, ...). Read the safety data sheet on the feed chemical.
- Drain and flush the liquid end before working on the pump.

**CAUTION!**

**Warning of feed chemical spraying around**

Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.

- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

**Danger of damage to the device**

Take into account the information in the "Storage, Transport and Unpacking" chapter if the system is decommissioned for a temporary period.

---

**Personnel:**

- Technical personnel

1. Disconnect the pump from the mains power supply.

2. Unscrew the back pressure valve from the discharge valve, slowly, to allow the pressure to reduce.
3. Empty the liquid end by turning the pump upside down and allowing the feed chemical to run out.

4. Flush the liquid end with a suitable medium; flush the dosing head thoroughly when using hazardous feed chemicals!

Disposal

**CAUTION!**

*Warning of feed chemical spraying around*

Feed chemical can spray out of the hydraulic components if they are manipulated or opened due to pressure in the liquid end and adjacent parts of the system.

- Disconnect the pump from the mains power supply and ensure that it cannot be switched on again by unauthorised persons.
- Depressurise the system before commencing any work on hydraulic parts.

**Personnel:**

- Technical personnel

**CAUTION!**

*Environmental hazard due to electronic waste*

There are electronic components in the pump, which can have a toxic effect on the environment.

- Separate the electronic components from the remaining parts.
- Note the pertinent regulations currently applicable in your country!

EC Declaration of Conformity

We, ProMinent Dosiertechnik GmbH
Im Schuhmachergewann 5 - 11
69123 Heidelberg, Germany

hereby declare that the product identified below, because of its design and construction, especially in the version brought to the market by us, fulfils the relevant and fundamental health and safety requirements specified by the EC directive. This declaration is no longer applicable if changes are made to the product without our authorisation.

Product description : Dosing pump, mikro delta series

Product type : MDLa...

Serial no. : see type plate on the unit

Relevant EC directives :
EC Machinery Directive (2006/42/EC)
The safety objectives of the Low Voltage Directive 2006/95/EC were complied with in accordance to Appendix 1, No. 1.5.1 of the Machinery Directive 2006/42/EG

Applied harmonised standards, especially :
EN ISO 12100-1, EN ISO 12100-2, EN 809, EN 13732, EN 61010-1, EN 60335-2-41, EN 61000-6-3-2, EN 61000-6-1/2/3/4

technical documentation was prepared by the documentation representative:
Norbert Berger
Im Schuhmachergewann 5-11
69123 Heidelberg, Germany

Date / Manufacturer - Signature : 06.04.2011
Dr. Johannes Hartfiel, Associate Head of Development
Decontamination declaration

Declaration of Decontamination
(see download: www.prominent.com)

Because of legal regulations and for the safety of our employees and operation equipment, we need the „declaration of decontamination“, with your signature, before your order can be handled.
Please make absolutely sure to include it with the shipping documents, or – even better – attach it to the outside of the packaging.

Please return your products to:
