General User Information

These operating instructions describe the technical data and function of the series DULCOMETER® D1C controller, provide detailed safety information and are divided into clear steps.

IMPORTANT

- Please observe the parts of these operating instructions applicable to your particular version! This is indicated in the Section "Device Identification / Identity Code"!
- Correct measuring and dosing is only possible in the case of impeccable operation of the probe. The probe has to be calibrated / checked regularly!

3 Device Overview / Controls

4 Functional Description

NOTE

Please refer to the description of the complete operating menu in Section 8 for a detailed description of the individual characteristics of the DULCOMETER[®] D1C controller!

4.1 Operating Menu

The D1C controller permits settings to be made in two different menus. All values are preset and can be changed in the **complete operating menu**.

The controller is delivered with a **restricted operating menu** so that the D1C controller can be used effectively in many applications from the very onset. If adaptations prove to be necessary, all relevant parameters can then be accessed by switching over to the complete operating menu (see "General settings").

4.2 Access Code

Access to the setting menu can be prevented by setting up an access code. The D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even when access to the setting menu is blocked by the code.

4.3 Control

The D1C can operate as a proportional controller or as a PID controller - dependent on the device version (see identity code) and the setting.

The controlled variable is recalculated once a second. Control procedures which require rapid correction of setpoint deviations (less than approx. 30 seconds) cannot be processed with this controller. The cycle times must be taken into consideration when activating solenoid valves (pulse length) in the same way as their running times when activating servomotors (3-point).

Via the control input pause, the control function (selection of controlled variable) can be switched off. The calculation of the controlled variable starts again after cessation of "pause".

4.4 Feed Forward Control

The D1C controller can process a signal of a feed forward control. Depending on the device version (see identity code) and the setting, this signal can be obtained in any form of a 0–20 mA or 4–20 mA signal or as a digital contact signal with the maximum frequencies 10 Hz or 500 Hz.

During start-up, the zero point has to be checked. The multiplicative feed forward control is not designed for switching off permanently the actuating variable (signal \approx 0).

This signal can be used, for example, for flow-proportional metering (multiplicative effect) or feed forwarddependent basic load metering (additive effect). The result of control variable calculation from the proportional or PID control is multiplied by or added to the feed forward signal. A multiplicative feed forward variable at the level of the set rated value carries over the calculated control variable unchanged into the controlled variable:

Controlled variable = Feed forward variable/rated value x calculated control variable

An additive feed forward variable at the level of the rated value results in maximum controlled variable:

Controlled variable (max. 100 %) = Feed forward variable/rated value x max. controlled variable + calculated control variable

4.5 Error Messages

Error messages and information are indicated on the bottom line in the permanent display 1. Errors to be

acknowledged (acknowledgement switches off the alarm relay) are indicated by the " \mathcal{E} ". Errors/notes which still apply after acknowledgement are indicated alternately. During correction variable processing (temperature for correction of pH-value), the value is indicated in the same line as the error/note. Faults which are rectified of their own accord due to changed operating situations are removed from the permanent display without the need for acknowledgement.

5 Display Symbols

The display of the DULCOMETER® D1C controller uses the following symbols:

Description	Comment	Symbol	
Limit value transgression Relay 1, upper	Symbol left	1	
Relay 1, lower	Symbol left	ŀ	
Relay 2, upper	Symbol right	1	
Relay 2, lower	Symbol right	•

Servomotor Control, open relay			
Control, close relay			
Without control			
Position feedback	Thickness of bar increases from left to right during opening		
Stop button pressed		0	
Manual metering		М	
Fault		3	

6 Operation

NOTE

Access to the setting menus can be barred with the access code!

The number and scope of setting menus is dependent on the device version!

If the access code is selected correctly in a setting menu, then the following setting menus are also accessible!

If within a period of 10 minutes no button is pushed, the unit automatically branches back from the calibrating menu or a setting menu to the permanent display 1.

7 Restricted Operating Menu / Overview

The restricted operating menu permits simple operation of the most important parameters. The following overview shows the settings which can be selected:

Restricted Operating Menu / Description

Calibrating the Chlorite Probe

During calibration, the control function persists. The standard signal of the output (measured value) remains unchanged. The measured value registered during the start of the calibration is proposed as the DPD value; this value is adjustable (arrow keys!). Calibration is only possible if the DPD value is ≥ 2 % of the measuring range. On successful completion of calibration, all error checks which refer to the measured value are restarted.

ATTENTION

The measuring range of the probe must agree with the set measuring range (factory setting: 0–2 ppm). The measuring range must be reset prior to calibration (refer to page 15).

	Possible values			
Initial value	Increment	Lower value	Upper value	Remarks
Measured value	0.01 ppm 0.001 ppm	-0.20 ppm -0.050 ppm	2.20 ppm 0.550 ppm	for measurement range up to 2 ppm for measurement range up to 0.5 ppm

Error message	Condition	Effect
Calibration Clt not possible! Probe slope too low	ClO_2^- slope too low (<25 % of norm slope)	Calibrate again
Calibration Clt not possible! Probe slope too high	CIO_2^{-} slope too high (>300 % of norm slope)	Calibrate again
DPD value too low DPD > x.xx ppm	DPD <2 % measuring range	

Restricted Operating Menu / Description

8 Complete Operating Menu / Overview

All parameters of the controller can be set in the complete operating menu (access see previous page). The following overview shows the settings which can be selected:

Calibrating the Chlorite Probe (zero point and slope)

The control function is retained during the calibration procedure. The standard signal of the output (measured value) is not changed. The measured value frozen at the start of calibration is offered as the DPD value; this value is adjustable (arrow keys!). Calibration is only possible when the DPD value is $\ge 2\%$ of the measurement range. Once calibration has been successfully completed, all fault tracing procedures which refer to the measured value are restarted.

Zero point calibration must be carried out under real conditions in water free of chlorite. Calibration is normally only necessary when measuring at the lower limit of the measuring range.

ATTENTION

The measuring range of the probe must agree with the set measuring range (factory setting: 0–2 ppm). The measuring range must be reset prior to calibration (refer to page 15).

		Possible values			
Initi	tial value	Increment	Lower value	Upper value	Remarks
Меа	easured value	0.01 ppm 0.001 ppm	-0.20 ppm -0.050 ppm	2.20 ppm 0.550 ppm	for measurement range up to 2 ppm for measurement range up to 0.5 ppm

Error message	Condition	Effect	
Calibration Clt not possible! Probe slope too low	CIO_2^- slope too low (<25 % of norm slope)	Calibrate again	
Calibration Clt not possible! Probe slope too high	CIO_2^- slope too high (>300 % of norm slope)	Calibrate again	
DPD value too low DPD > x.xx ppm	DPD <2 % of measuring range		
Zero point too low Zero point too high	< 3 mA > 5 mA at 2 ppm > 6 mA at 0.5 ppm	Check probe/cable Repeat calibration in chlorite-free water	

Measuring Range

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Measuring range	02 ppm	00.5 ppm 02 ppm			

IMPORTANT

If the area allocation is changed, the chlorite must be re-calibrated and all the menu settings must be checked!

Measured Value

IMPORTANT

If the area allocation is changed, the chlorite must be re-calibrated and all the menu settings must be checked!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Standard signal input lower signal limit	4 mA	0 mA 4 mA			
Allocated measured value lower upper	0 ppm 0 ppm 2.0 ppm 2.0 ppm	0.01 ppm 0.001 ppm 0.01 ppm 0.001 ppm	-0.20 ppm -0.05 ppm -0.20 ppm -0.05 ppm	2.20 ppm 0.550 ppm 2.20 ppm 0.550 ppm	for CLT1-mA-2 ppm for CLT1-mA-0.5 ppm for CLT1-mA-2 ppm for CLT1-mA-0.5 ppm
Checkout time	off	1 s	1 s	9999 s	Constant measurement signal results in message and alarm. Function off = 0 s

Zero point

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Zero point setting CLT 1-mA-0.5 ppm CLT 1-mA-2 ppm	4.80 mA 4.20 mA	0.01 mA	3.80 mA	6.00 mA 5.00 mA	

Pumps

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Max. stroke/minute of pumps 1 and 2	180	1	1	500	off = 0 strokes/min

Relay for power control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Relay adjustment	as per identity code				
Relay 1		Solenoid valve 1 Limit value 1* Actuator 1 off			*For "limit value", the relays remain active, even in the event of a fault.
Relay 2		Solenoid valve 2 Limit value 2* Actuator 2 off			
Cycle min. time	10 s 1 s	1 s 1 s	10 s 1 s	9999 s Cycle/2	

The switching time of the DULCOMETER® D1C (solenoid valve) depends on the actuating variable and the "min. time" (smallest permitted operating factor of the connected device).

The actuating variable determines the ratio t_{on}/cycle and thus the switching times (see fig. above).

The "min. time" influences the switching times in two situations:

a) theoretical switching time < min. time:

The DULCOMETER® D1C does not switch for a certain number of cycles until the sum of the theoretical switching times exceeds the "min. time". Then the DULCOMETER® D1C switches for the duration of this total time.

b) theoretical switching time > (cycle - min. time) and calculated switching time < cycle

The DULCOMETER® D1C does not deactivate for a certain number of cycles until the differences between cycle and theoretical switching time exceed the "min. time".

Limit values

		Initial value	Possible values	S Lower value	Upper value	Remarks
Type of limit tran	nsgression Limit 1: Limit 2:	lower upper	upper lower off *)			Limit transgression when exceeding or dropping below value *) only with limit relay
Limit value	Limit 1: Limit 2:	0.025 ppm 0.375 ppm	0.001 ppm	-0.05 ppm	0.550 ppm	for CLT 1-mA-0.5 ppm
Limit value	Limit 1: Limit 2:	0.10 ppm 1.50 ppm	0.01 ppm	-0.20 ppm	2.20 ppm	for CLT 1-mA-2 ppm
Switch-on delay	Δt on	0 s	1 s	0 s	9999 s	
Switch-off delay	Δt off	0 s	1 s	0 s	9999 s	
Hysteresis limits		0.010 ppm 0.04 ppm	0.001 ppm 0.01 ppm	0 ppm 0 ppm	0.550 ppm 2.20 ppm	Effective in direction of "cancelling limit transgression"
Checkout time li	mits	off	1 s	1 s	9999 s	Results in message and alarm. off = 0 s: Function switched off, no message, no alarm

Servomotor

Activation of the servomotor must be carried out with the same meticulous care as taken when calibrating a measuring probe. The **operating range** is defined by the total resistance range of the feedback potentiometer. The maximum limit of the range actually used is set by defining the **control range**.

CAUTION

To ensure correct operation, the activation time of the actuator used should not be less than 25 seconds for the control range from 0...100 %!

		Possible values	1	1	
	Initial value	Increment	Lower value	Upper value	Remarks
Servomotor	Setting	Setting ok off			
Control direction	Chlorite	Chlorite De-Clt			
Control range	100 %	1 %	10 %	100 %	in % of operating range

Control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Control	normal	normal with dead zone manual			When controlling with dead zone, the regulated value is not used for measured values within the dead zone.
			lower limit	upper limit	2 setpoints necessary for control with dead zone.
Setpoint setting	0.100 ppm 0.20 ppm	0.001 ppm 0.01 ppm	-0.025 ppm -0.10 ppm	0.525 ppm 2.10 ppm	Setpoint $2 \ge$ Setpoint 1
Control parameter xp	10 %	1 %	1 %	500 %	xp referred to measuring range
Control parameter Ti	off	1 s	1 s	9999 s	Function off $= 0$ s
Control parameter Td	off	1 s	1 s	2500 s	Function of $f = 0$ s
Additional basic load	0 %	1 %	-100 %	+100 %	
Manual metering	0 %	1 %	-100 %	+100 %	

Abbreviations for control variables:

- x_p: 100 %/Kp (inverse proportional coeffizient)
- T: Integration time of I-controller [s]
- T_d : Differential time of D-controller [s]

Feed forward control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Feed forward control (Flow)	as per identity code at standard signal: 4–20 mA	None 10 Hz 500 Hz 020 mA 420 mA			Signal processing: Signal <0.02 Hz = No flow Signal <0.2 Hz = No flow Signal <0.2 mA = No flow Signal <0.2 mA = No flow
Feed forward control rated value	10 Hz 500 Hz 20 mA	0.01 Hz 1 Hz 0.1 mA	0.1 Hz 1 Hz 0/4 mA	10 Hz 500 Hz 20 mA	Depended on signal type. Maximum limitation of range used.
Feed forward control effect	multiplicative	multiplicative additive			
Max. add. regulated value	100 %	1 %	-500 %	+500 %	only with add. feed forward control

Standard Signal Output 1

Standard Signal Output 2

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Variable allocation	as per identity code	Measured value Control output			If control is present
Output range	020 mA	020 mA 420 mA			
Range measured value	01.00 ppm 00.500 ppm	0.01 ppm 0.001 ppm	-0.20 ppm -0.05 ppm	2.20 ppm 0.550 ppm	for CLT1-mA-2 ppm for CLT1-mA-0.5 ppm
Range controlled variable	-100 %0 %	1 %	-100 %	+100 %	Minimum range 1 %

General setting

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Alarm relay	active	active not active			
Pause	normal	normal hold			
Control input pause	active closed	active closed active open			

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Pause alarm	alarm off	alarm off alarm on			Alarm relay can be activated by pause contact.
td	0 min	1 min	0 min	60 min	
Access code	5000	1	1	9999	
Language	as per identity code	German English French Italian Dutch Spanish Portuguese Czech Japanese (as per identity code)			
Operating menu	complete	restricted complete			

Standard Pause

If the pause-switch is off, the DULCOMETER[®] D1C sets the operating outputs to "0" for as long as the pause-switch is off or for a set time-delay t_a (if t_a is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2): the I-proportion is stored when the pause is switched off (I-proportion then usually only present if Ti > 0 has been selected in the "Control setting?" setting menu).

Exception: the standard signal outputs mA for the measured value or correction value are not affected by the pause.

After pause is activated the operating outputs remain at "0" for the length of the time-delay t_d . The time-delay t_d must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay t_d is reconciled jointly with the current P-component and (if Ti is set > 0) with the stored I-component.

Pause Hold

If the pause-switch is off, the DULCOMETER[®] D1C freezes the operating output at the most recent value for as long as the pause-switch is off or for a set time-delay t_d (if t_d is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2):

Even the mA standard signal outputs for measured value or correction value are frozen.

After pause is activated the operating outputs remain frozen for the length of the time delay t_{d} . The time delay t_{d} must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay t_d is reconciled jointly with the current P-proportionand (if Ti is set > 0) with the newly established I-proportion.
