### **General User Information**

These operating instructions describe the technical data and function of the DULCOMETER® D1C controller, provide detailed safety information and are divided into clear steps.

#### IMPORTANT

- Please observe the parts of these operating instructions applicable to your particular version! This is indicated in the Section "Device Identification / Identity Code"!
- Correct measuring and dosing is only possible in the case of impeccable operation of the sensor. The sensor has to be calibrated / checked regularly!

#### NOTE

A form "Documentation of controller settings type D1C" is available under www.prominent.com/documentation\_D1C for the purpose of documenting the controller settings.

# 3 Device Overview / Controls

|      |   | 1 |  |
|------|---|---|--|
| Ś    | CHANGE button<br>To change over within a menu level<br>and to change from one variable to<br>another within a menu point. |   | UP button<br>To increase a displayed numerical value<br>and to change variables (flashing<br>display)    |
| STOP | START/STOP button<br>Start/stop of control and metering<br>function.  |   | BRANCH BACK button<br>Back to permanent display or to start<br>of relevant setting menu.                 |
|      | ENTER button<br>To accept, confirm or save a dis-<br>played value or status. For alarm<br>acknowledgement.                |   | DOWN button<br>To decrease a displayed numerical<br>value and to change variables (flashing<br>display). |

### NOTE

Please refer to the description of the complete operating menu in Section 8 for a detailed description of the individual characteristics of the DULCOMETER<sup>®</sup> D1C controller!

#### 4.1 Operating Menu

The D1C controller permits settings to be made in two different menus. All values are preset and can be changed in the **complete operating menu**.

The controller is delivered with a **restricted operating menu** so that the D1C controller can be used effectively in many applications from the very onset. If adaptations prove to be necessary, all relevant parameters can then be accessed by switching over to the complete operating menu (see "General settings").

#### 4.2 Access Code

Access to the setting menu can be prevented by setting up an access code. The D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even if access to the setting menu is blocked by the code.

### 4.3 Control

The D1C can operate as a proportional controller or as a PID controller - dependent on the device version (see identity code) and the setting.

The controlled variable is recalculated once a second. Control procedures which required rapid correction of setpoint deviations (less than approx. 30 seconds) cannot be processed with this controller. The cycle times must be taken into consideration when activating solenoid valves (pulse length) in the same way as their running times when activating servomotors (3-point).

Via the control input pause, the control function (selection of controlled variable) can be switched off. The calculation of the controlled variable starts again after cessation of "pause".

### 4.4 Feed Forward Control

The D1C controller can process a signal of a feed forward control. Depending on the device version (see identity code) and the setting, this signal can be obtained in any form of a 0–20 mA or 4–20 mA signal or as a digital contact signal with the maximum frequencies 10 Hz or 500 Hz.

This signal can be used, for example, for flow-proportional metering (multiplicative effect) or feed forwarddependent basic load metering (additive effect). The result of control variable calculation from the proportional or PID control is multiplied by or added to the feed forward signal. A multiplicative feed forward variable at the level of the set rated value carries over the calculated control variable unchanged into the control variable:

#### Control variable = Feed forward variable/rated value x calculated control variable

During start-up, the zero point has to be checked. The multiplicative feed forward control is not designed for switching off permanently the actuating variable (signal  $\approx 0$ ).

An additive feed forward variable at the level of the rated value results in maximum control variable:

Control variable (max. 100 %) = Feed forward variable/rated value x max. control variable + calculated control variable

#### 4.5 Error Messages

Error messages and information are indicated in the bottom line in the permanent display 1. Errors to be

acknowledged (acknowledgement switches off the alarm relay) are indicated by the " $\mathcal{E}$ ". Errors/notes which still apply after acknowledgement are indicated alternately. During correction variable processing (temperature for correction of pH-value), the value is indicated in the same line as the error/note. Faults which are rectified of their own accord due to changed operating situations are removed from the permanent display without the need for acknowledgement.

# 5 Display Symbols

The display of the DULCOMETER  $^{\ensuremath{\$}}$  D1C controller uses the following symbols:

| Description                                  | Comment  | Symbol |  |  |
|--|--|--------|--|--|
| Limit value transgression<br>Relay 1, upper  | Symbol<br>left   | 1      |  |  |

# 6 Operation

### NOTE

Access to the setting menus can be barred with the access code!

The number and scope of setting menus is dependent on the device version!

If the access code is selected correctly in a setting menu, then the following setting menus are also accessible!

If within a period of 10 minutes no button is pressed, the unit automatically branches back from the calibrating menu or a setting menu to the permanent display 1.

# 7 Restricted Operating Menu / Layout

#### Calibration of the Chlorine sensor

During the calibration, the D1C sets the controller outputs to "0". Exception: If a base load or manual controller output was set, these are maintained during the calibration. The standard signal outputs mA (measured value or correction value) are frozen. The measured value registered during the start of the calibration is proposed as the DPD value; this value is adjustable (arrow keys!). Calibration is only possible if the DPD value is  $\geq 2$  % of the measuring range. On successful completion of calibration, all error checks which refer to the measured value are restarted.

### IMPORTANT

The measuring range of the chlorine sensor must correspond to the adjusted measuring range (factory setting: 0–2 ppm). A change of the measuring range (see page 17) must be done before calibration!

|                | Possible values |             |             |         |  |  |  |
|----------------|-----------------|-------------|-------------|---------|--|--|--|
| Initial value  | Increment       | Lower value | Upper value | Remarks |  |  |  |
| Measured value | 0.01 ppm        | 0 ppm       | 100 ppm     |         |  |  |  |

| Error message   | Condition                   | Effect                               |
|---|-----------------------------|--------------------------------------|
| Calibration CI not possible!<br>Sensor slope too low<br>(<25 % of norm slope)   | CI slope too low            | Calibrate again                      |
| Calibration CI not possible!<br>Sensor slope too high<br>(>300 % of norm slope) | Cl slope too high           | Calibrate again                      |
| DPD value too low!<br>DPD > x.xx ppm  | DPD <2 % of measuring range | Calibrate again after adding chorine |

#### Calibrating the pH sensor (only possible with correcting variable pH)

The pH sensor is calibrated with the aid of two-point calibration (zero point/slope). Buffer self-detection at pH 7 (zero point calibration) and at pH 4 (calibration of slope). The measured pH value of the buffer is proposed as the buffer value and can be changed manually (arrow keys). The control is stopped during calibration and reduced to the set basic load. The measured value is frozen. The errors relating to the corresponding measured variable are reset after successful calibration. The current data of the pH sensor (zero point and slope) are displayed.

|               |   | Possible values |             |             |   |
|---------------|---|-----------------|-------------|-------------|---|
|               | Initial value                                 | Increment       | Lower value | Upper value | Remarks   |
| Buffer values | Rounded-off<br>whole number<br>measured value | pH 0.01         | рН -2       | pH 16       | Error messages<br>when both buffers too<br>close (<2 pH values).  |
|               |   |                 |             |             | In order to operate perfectly,<br>the pH sensor must be checked<br>and calibrated regularly (weekly),<br>since deviations of ±0.1 pH may<br>cause errors of measurement.<br>Further more, when using a CLE<br>sensor, a slope calibration adjustment<br>of the chlorine sensor should always<br>be done after a pH calibration. |

#### IMPORTANT

pH correction is not possible if there are oxidating substances in the sample water! When a CLE measuring sensor is used:

- The temperature must be between 10 °C and 15 °C
- The pH value must be between 5 and 8
- The corrective sensor current is limited to 25 mA

| Error message   | Condition   | Comment  |  |
|---|---|--|--|
| Buffer distance too small   | $\Delta$ Buffer < pH 2  | During calibration procedure:<br>Recalibrate buffer 2!                             |  |

#### Access Code

Access to the setting menu can be prevented by setting up an access code. The DULCOMETER<sup>®</sup> D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even if access to the setting menu is blocked by the code.

All parameters of the controller can be set in the complete operating menu (access see previous page). The following overview shows the settings which can be selected:

### Calibration of the Chlorine sensor (Zero point and slope)

During the calibration, the D1C sets the controller outputs to "0". Exception: If a base load or manual controller output was set, these are maintained during the calibration. The standard signal outputs mA (measured value or correction value) are frozen. The measured value frozen at the start of calibration is offered as the DPD value; this value is adjustable (arrow keys!). Calibration is only possible if the DPD value is  $\geq 2$  % of the measurement range. Once calibration has been successfully completed, all fault tracing procedures which refer to the measured value are restarted.

Zero point calibration must be carried out under real conditions in water free of chlorine dioxide. Calibration is normally only necessary for the measuring range 0 - 0.5 ppm when measuring at the lower limit of the measuring range.

### IMPORTANT

The measuring range of the sensor must agree with the set measuring range (factory setting: 0–2 ppm). The measuring range must be reset prior to calibration (see page 17).

|                | Possible values |             |             |         |
|----------------|-----------------|-------------|-------------|---------|
| Initial value  | Increment       | Lower value | Upper value | Remarks |
| Measured value | 0.01 ppm        | 0 ppm       | 100 ppm     |         |

| Error message                                       | Condition         | Comment  |
|---|-------------------|--|
| Calibration CI not possible!<br>Zero point too low  | Zero point < 3 mA | Repeat calibration in sample water without chlorine! |
| Calibration Cl not possible!<br>Zero point too high | Zero point > 5 mA | Repeat calibration in sample water without chlorine! |

| Error message                              | Condition                                   | Effect                                |
|--|---|---------------------------------------|
| Calibration CI not possible!<br>Slope low  | Slope Cl too low<br>(<25 % of norm slope)   | Calibrate again!                      |
| Calibration CI not possible!<br>Slope high | Slope Cl too high<br>(>300 % of norm slope) | Calibrate again!                      |
| DPD value too low<br>DPD > x.xx ppm        | DPD <2 % measuring range                    | Calibrate again after adding chlorine |

#### Calibrating the pH sensor (only possible with correcting variable pH)

The pH sensor is calibrated with the aid of two-point calibration (zero point/slope). Buffer self-detection at pH 7 (zero point calibration) and at pH 4 (calibration of slope). The measured pH value of the buffer is proposed as the buffer value and can be changed manually (arrow keys). The control is stopped during calibration and reduced to the set basic load. The measured value is frozen. The errors relating to the corresponding measured variable are reset after successful calibration. The current data of the pH sensor (zero point and slope) are displayed.

|               |   | Possible values |             |             |   |
|---------------|---|-----------------|-------------|-------------|---|
|               | Initial value                                 | Increment       | Lower value | Upper value | Remarks   |
| Buffer values | Rounded off<br>whole number<br>measured value | pH 0.01         | рН -2       | pH 16       | Error messages<br>when both buffers too<br>close (<2 pH values).  |
|               |   |                 |             |             | In order to operate perfectly,<br>the pH sensor must be checked<br>and calibrated regularly<br>(weekly), since deviations<br>of ±0.1 pH may cause errors of<br>measurement. Further more,<br>when using a CLE sensor,<br>a slope calibration adjustment<br>of the chlorine sensor should<br>always be done after a<br>pH calibration. |

| Error message   | Condition  | Comment  |  |
|---|--|--|--|

| Measurde value °C unstable  |  |  |  |

#### Measuring range

#### IMPORTANT

The chlorine sensor must be recalibrated and the settings checked in all menus after changing the range allocation!

|                 | Initial value | Possible values<br>Increment  | Lower value | Upper value | Remarks |
|-----------------|---------------|---|-------------|-------------|---------|
| Measuring range | 02 ppm        | 00.5 ppm<br>02 ppm<br>05 ppm<br>010 ppm<br>020 ppm<br>050 ppm<br>0100 ppm |             |             |         |

#### Measured value

#### IMPORTANT

The chlorine sensor must be recalibrated and the settings checked in all menus after changing the range allocation!

#### Measured value checkout time

### IMPORTANT

This function may not be activated for applications in which it can be assumed that the measured value will not change.

This function tests whether the measured value varies from that of the sensor (at the measured value input) within the "Measured value checkout time". It is assumed that it will do so for an intact sensor. If the measuring value does not change during this checkout time, the DULCOMETER® D1C sets the control variable to "0" and the alarm relay drops out. The LCD display shows e.g. the message "Check Cl probe".

|   |                | Possible values |             |             |  |
|---|----------------|-----------------|-------------|-------------|--|

| t on      | 1 min         | 1 min           | 1 min       | 60 min      | for timer   |

#### NOTE

The limit value relay can be defined in such a way as to respond as a control element, i.e. if a limit value relay closes a circuit, it opens when a pause contact is activated and/or for a subsequent delay period  $t_a$  (if  $t_a$  is set to > 0 min in "General settings").

#### IMPORTANT

The timer will reset in the event of a power failure.

At the end of the (timer) cycle time the DULCOMETER<sup>®</sup> D1C closes the assigned relay for the duration of "t on" (timer). "Pause" interrupts the timer.

When the clock is shown in the LC display the timer can be reset to the start of the cycle at precisely this point using the enter button.

The % figure in the LC display indicates the progress of the current cycle.

Timer relays may be used, e.g. for shock metering or sensor cleaning.

The switching time of the DULCOMETER<sup>®</sup> D1C (solenoid valve) depends on the control variable and the "min. time" (smallest permitted operating factor of the connected device).

The control variable determines the ratio  $t_{on}$ /cycle and thus the switching times (see fig. above).

The "min. time" influences the switching times in two situations:

a) theoretical switching time < min. time:

The DULCOMETER® D1C does not switch for a certain number of cycles until the sum of the theoretical switching times exceeds the "min. time". Then the DULCOMETER® D1C switches for the duration of this total time.

The DULCOMETER® D1C does not deactivate for a certain number of cycles until the differences between cycle and theoretical switching time exceed the "min. time".

#### Limits

|   |                               |                      | Possible value               | es                   |                        |   |

| Switch-off del                                    | ay ∆t off                     | 0 s                  | 1 s                          | 0 s                  | 9999 s                 |   |

If the limit is exceeded for longer than the "Delay time limit values" an error message is given, which must be acknowledged, and the alarm relay circuit drops out. If "Controller" is also set to "off" the control process stops.

### Servomotor

The **operating range** is defined by the total resistance range of the feedback potentiometer. The maximum limit of the range actually used is set by defining the **control range**.

### IMPORTANT

- To ensure correct function, the set duration of the stroke position motor should be more than 25 sec for 0...100 % of setting range.
- Stroke adjustment motor actuation must be carried out with the same care as the calibration of a sensor!

|                   |               | Possible values        |             |             |                         |

| Servomotor        | Setting       | Setting<br>ok<br>off   |             |             |                         |
| Control direction | Chlorine      | Chlorine<br>Dechlorine |             |             |                         |
| Control range     | 100 %         | 1 %                    | 10 %        | 100 %       | in % of operating range |

#### NOTE

- When the wide bar is as right as it will go the stroke adjustment motor is fully open.
- The permanent display shows to what degree the motor has opened in % (the greater the percentage, the farther open the stroke adjustment motor).

#### **Pause Normal**

If the pause-switch is off, the DULCOMETER<sup>®</sup> D1C sets the operating outputs to "0" for as long as the pause-switch is off or for a set time-delay  $t_d$  (if  $t_d$  is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2): the I-proportion is stored when the pause is switched off (I-proportion then usually only present if Tn > 0 has been selected in the "Control setting?" setting menu).

Exception: the standard signal outputs mA for the measured value or correction value are not affected by the pause.

After pause is activated the operating outputs remain at "0" for the length of the time-delay  $t_d$ . The timedelay  $t_d$  must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay  $t_d$  is reconciled jointly with the current P-component and (if Tn is set > 0) with the stored I-component.

#### Pause Hold

If the pause-switch is off, the DULCOMETER<sup>®</sup> D1C freezes the operating output at the most recent value for as long as the pause-switch is off or for a set time-delay  $t_d$  (if  $t_d$  is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2):

Even the mA standard signal outputs for measured value or correction value are frozen.

After pause is activated the operating outputs remain frozen for the length of the time delay  $t_{d}$ . The time delay  $t_{d}$  must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay  $t_d$  is reconciled jointly with the current P-proportionand (if Tn is set > 0) with the newly established I-proportion.

#### Access Code

Access to the setting menu can be prevented by setting up an access code. The DULCOMETER<sup>®</sup> D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even when access to the setting menu is blocked by the code.
