General User Information

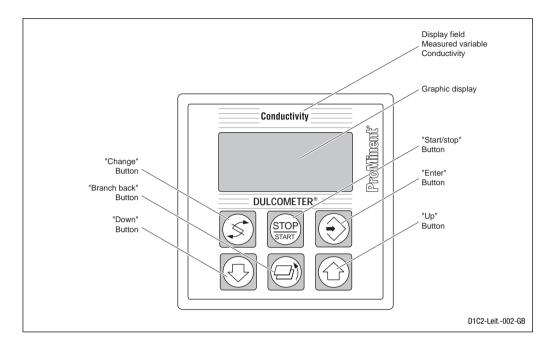

These operating instructions describe the technical data and function of the series DULCOMETER® D1C controller, provide detailed safety information and are divided into clear steps.

IMPORTANT

- Please observe the parts of these operating instructions applicable to your particular version! This is indicated in the Section "Device Identification / Identity Code"!
- Correct measuring and dosing is only possible in the case of impeccable operation of the probe. The probe has to be calibrated / checked regularly!

3 Device Overview / Controls

CHANGE button

To change over within a menu level and to change from one variable to another within a menu point.

START/STOP button

Start/stop of control and metering function.

FNTFR button

To accept, confirm or save a displayed value or status. For alarm acknowledgement.

UP button

To increase a displayed numerical value and to change variables (flashing display)

BRANCH BACK button

Back to permanent display or to start of relevant setting menu.

DOWN button

To decrease a displayed numerical value and to change variables (flashing display).

4 Functional Description

NOTE

Please refer to the description of the complete operating menu in Section 8 for a detailed description of the individual characteristics of the DULCOMETER® D1C controller!

4.1 Operating Menu

The D1C controller permits settings to be made in two different menus. All values are preset and can be changed in the **complete operating menu**.

The controller is delivered with a **restricted operating menu** so that the D1C controller can be used effectively in many applications from the very onset. If adaptations prove to be necessary, all relevant parameters can then be accessed by switching over to the complete operating menu.

4.2 Access Code

Access to the setting menu can be prevented by setting up an access code. The D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even when access to the setting menu is blocked by the code.

4.3 Control

The D1C can operate as a proportional controller or as a PID controller - dependent on the device version (see identity code) and the setting.

The controlled variable is recalculated once a second. Control procedures which require rapid correction of setpoint deviations (less than approx. 30 seconds) cannot be processed with this controller. The cycle times must be taken into consideration when activating solenoid valves (pulse length) in the same way as their running times when activating servomotors (3-point).

Via the control input pause, the control function (selection of controlled variable) can be switched off. The calculation of the controlled variable starts again after cessation of "pause".

4.4 Feed Forward Control

The D1C controller can process a signal of a feed forward control. Depending on the device version (see identity code) and the setting, this signal can be obtained in any form of a 0–20 mA or 4–20 mA signal or as a digital contact signal with the maximum frequencies 10 Hz or 500 Hz.

During start-up, the zero point has to be checked. The multiplicative feed forward control is not designed for switching off permanently the actuating variable (signal \approx 0).

This signal can be used, for example, for flow-proportional metering (multiplicative effect) or feed

forward-dependent basic load metering (additive effect). The result of control variable calculation from the proportional or PID control is multiplied by or added to the feed forward signal. A multiplicative feed forward variable at the level of the set rated value carries over the calculated control variable unchanged into the controlled variable:

Controlled variable = Feed forward variable/rated value x calculated control variable

An additive feed forward variable at the level of the rated value results in maximum controlled variable:

Controlled variable (max. 100 %) = Feed forward variable/rated value x max. controlled variable + calculated control variable

4.5 Error Messages

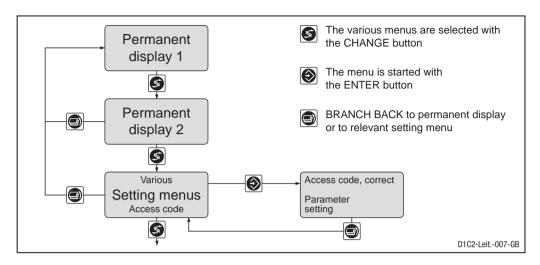

Error messages and information are indicated on the bottom line in the permanent display 1. Errors to be acknowledged (acknowledgement switches off the alarm relay) are indicated by the symbol "É". Errors/notes which still apply after acknowledgement are indicated alternately. Faults which are rectified of their own accord due to changed operating situations are removed from the permanent display without the need for acknowledgement.

5 Display Symbols

The display of the DULCOMETER® D1C controller uses the following symbols:

Description	Comment	Symbol
Limit value transgression Relay 1, upper	Symbol left	1
Relay 1 lower	Symbol left	ļ.
Relay 2 upper	Symbol right	1
Relay 2 lower	Symbol right	,
Metering pump 1 (Increase conductivity) Control OFF	Symbol left	
Control ON	Symbol left	
Metering pump 2 (Reduce conductivity) Control OFF	Symbol right	
Control ON	Symbol right	
Solenoid valve 1 (Increase conductivity) Control OFF	Symbol left	4
Control ON	Symbol left	
Solenoid valve 2 (Reduce conductivity) Control OFF	Symbol right	k
Control ON	Symbol right	
Servomotor Control, open relay		
Control, close relay		1 L
Without control		4
Position feedback	Thickness of bar increases from left to right during opening	
Stop button pressed		0
Manual metering		М
Fault		3

6 Operation

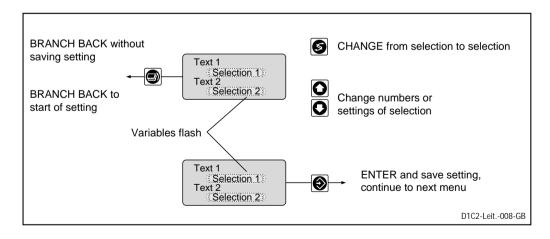

NOTE

Access to the setting menus can be barred with the access code!

The number and scope of setting menus is dependent on the device version!

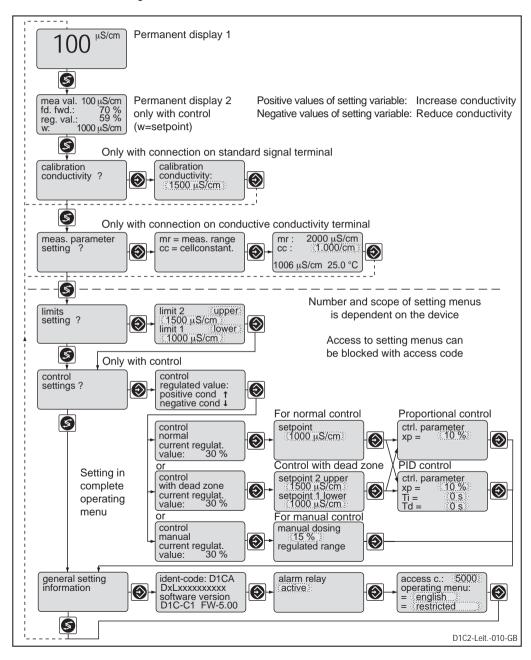

If the access code is selected correctly in a setting menu, then the following setting menus are also accessible!

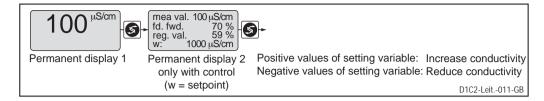

If within a period of 10 minutes no button is pushed, the unit automatically branches back from the calibrating menu or a setting menu to the permanent display 1.

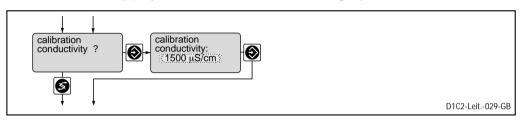

7 Restricted Operating Menu / Overview

The restricted operating menu permits simple operation of the most important parameters. The following overview shows the settings which can be selected:

Calibration conductivity (only for connected terminal standard signal)

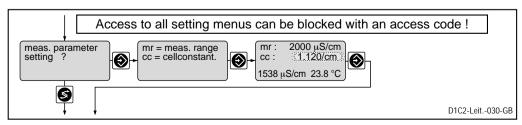

During calibration, the D1C sets the command outputs to "0". Exception: if a basic load or a manual control output were set, these are maintained during calibration. The standard signal outputs mA (measuring value or correction value) are frozen.

The actually measured value will be proposed; this value is adjustable (arrow keys). On successful completion of calibration, all error checks which refer to the measured value are restarted.

		Possible values		
	Initial value	Increment	Lower value	Upper value
Calibration conductivity	measured value	as per measuring range	as per measuring range	as per measuring range

Error message	Condition effect	Remarks
Measured value too low Value > xx mS/cm Check measuring range	value < 2 % of measuring range	check measuring range
Measured value too high Value < xx mS/cm Check measuring range	value > 100 % of measuring range	check measuring range

Calibration conductivity (only for connected terminal conductive conductivity) Measuring parameter

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Cellconstant cc	1.000/cm	0.0001/cm 0.001/cm 0.01/cm	0.0060/cm 0.150/cm 1.50/cm	0.1499/cm 1.499/cm 12.00/cm	cc can be adjusted for all mr over the complete area

The measured value can be adjusted to the actual conductivity value by changing the cell constants (arrow keys).

NOTE
The following menus apply generally!

Limits

		Initial value	Increment	Lower value	Upper value	Remarks

Operating menu	restricted	restricted complete			

8 Complete Operating Menu / Overview

All parameters of the controller can be set in the complete operating menu (access see previous page). The following overview shows the settings which can be selected:

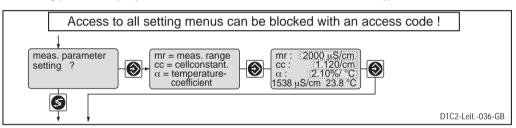

With connection on terminal standard signal see page 18

With connection on terminal conductive conductivity:

Measuring parameter (only for connected terminal conductive conductivity)

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Measuring range mr	02000 μS/cm	020 μS/cm 0200 μS/cm 02000 μS/cm 020 mS/cm 0200 mS/cm			setpoints and limit values are switched to the corresponding startup values
Cellconstant cc	1000 /cm	0.0001/cm 0.001/cm 0.01/cm	0.0060/cm 0.150/cm 1.50/cm	0.1499/cm 1.499/cm 12.00/cm	cc can be adjusted for all mr over the complete area
Temperature-coefficient α	1.90 %/°C	0.01 %/°C	0 %/°C	10 %/°C	

The measured value can be adjusted to the actual conductivity value by changing the cell constants (arrow keys). Prerequisite is a known temperature coefficient and a constant temperature.

IMPORTANT

When changing the measuring range, metering and control are stopped, the setpoints, limit values, and the standard signal output are set to the corresponding startup values! Check these settings in all menus!

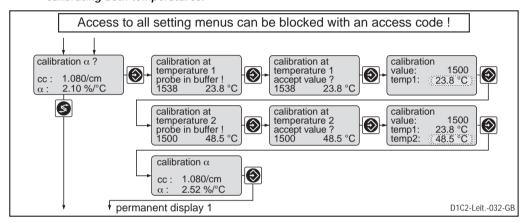

Calibrating temperature coefficient α (only for connected terminal conductive conductivity)

The temperature coefficient is newly determined by a 2-point calibration. During calibration, the D1C sets the command outputs to "0". Exception: if a basic load or a manual control output were set, these are maintained during calibration. The standard signal outputs mA (measuring value or correction value) are frozen.

ATTENTION

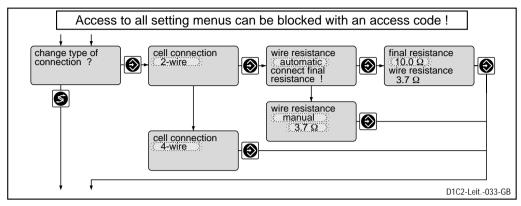

The conductivity values you enter must base on 25 °C. You must use the same solution when calibrating both temperatures!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Measuring range
Set probe	measuring value	0.01 μS/cm 0.1 μS/cm 1 μS/cm 0.01 mS/cm 0.1 mS/cm	-1 μS/cm -10 μS/cm -100 μS/cm -1 mS/cm -10 mS/cm	21 μS/cm 210 μS/cm 2100 μS/cm 21 mS/cm 210 mS/cm	20 μS/cm 200 μS/cm 2000 μS/cm 20 mS/cm 200 mS/cm
Set temperature	correction value	0.1 °C	0 °C	100 °C	

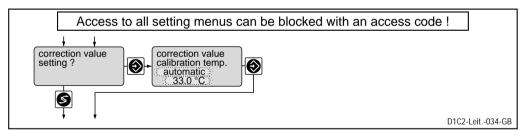

Error message/Warning	Condition	Remarks
Temperature range restricted xx - 100 °C		For the chosen temperature coefficient α , a correct reading can only be obtained for the displayed temperature range.
Temperature distance wrong	Δ temperature \geq 10.0 °C Δ temperature \leq 50.0 °C	

Cell connection (only for connected terminal conductive conductivity)

	Initial value	Increment	Lower value	Upper value
Probe connection	2-wire 4-wire	2-wire		
Determine wire resistance	manual	manual automatic		
Manual entry wire resistance	0.5 Ω	0.1 Ω	0 Ω	50 Ω
Final resistance	10.0 Ω	0.1 Ω	10 Ω	50 Ω

Correction value (only for connected terminal conductive conductivity)

		Possible values		
	Initial value	Increment	Lower value	Upper value
Type of temperature compensation	• • • • • • • • • • • • • • • • • • • •		manual automatic off	
Manual temperature	25 °C	0.1 °C	0 °C	100 °C
Automatic temperature correction value		0.1 °C	0 °C	100 °C

Calibration conductivity (only for connected terminal standard signal)

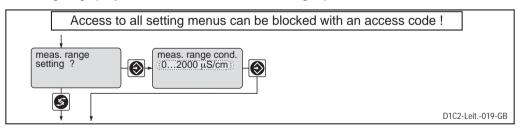

During calibration, the D1C sets the command outputs to "0". Exception: if a basic load or a manual control output were set, these are maintained during calibration. The standard signal outputs mA (measuring value or correction value) are frozen.

The actually measured value will be proposed; this value is adjustable (arrow keys). On successful completion of calibration, all error checks which refer to the measured value are restarted.

		Possible values			
	Initial value	Increment	Lower value	Upper value	
Calibration conductivity	measured value	as per measuring range	as per measuring range	as per measuring range	

Error message	Condition effect	Remarks
Measured value too low value > xx mS/cm Check measuring range	value < 2 % of measuring range	check measuring range
Measured value too high value < xx mS/cm Check measuring range	value > 100 % of measuring range	check measuring range

Measuring range (only for connected terminal standard signal)

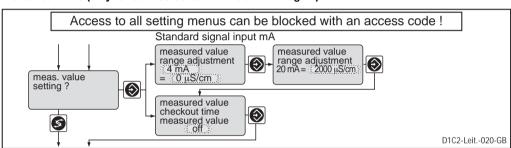

IMPORTANT

When changing the measuring range, setpoints and limit values are switched over to their respective initial values. The settings must be checked in all menus!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Measuring range	02000 μS/cm	01000 mS/cm* 020 mS/cm 020 mS/cm 05000 μS/cm* 0500 μS/cm* 0500 μS/cm 0500 μS/cm 050 μS/cm 050 μS/cm			Setpoints and limit values are switched over to their respective initial values * only with connection on standard signal

Measured value (only for connected terminal standard signal)

IMPORTANT

When changing the range adjustment, the adjustments in all menus have to be checked!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Standard signal input lower signal limit	4 mA	0 mA 4 mA			
Allocated special voltage	0-2000 μS/cm	depending on measuring range	-5 % of final value	+5 % of final value	
Checkout time	off	1 s	1 s	9999 s	Constant measurement signal results in message and alarm. Function off = 0 s

Control time measuring value

IMPORTANT

This function may not be activated for applications where it can be assumed that the measuring value does not change.

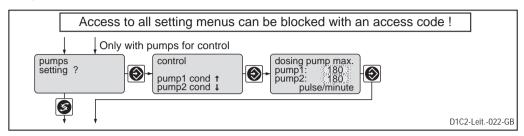

This function checks whether the measuring value from the probe (measuring value input) changes within the "control time measuring value". It is assumed that the value does not change for an intact probe.

If the measuring value does not change during this control time, the DULCOMETER® D1C sets the control output to "0" and the alarm relay drops out. The LCD display shows e.g. the message "Check pH probe".

NOTE

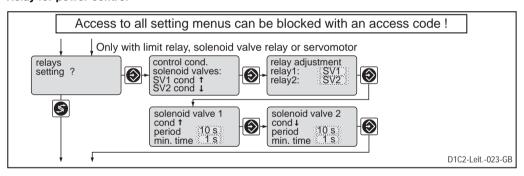

The following menus apply generally.

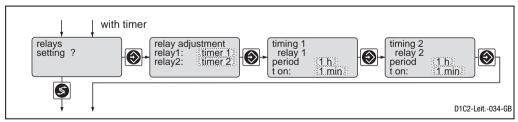

Pumps

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Max. stroke/minute of pumps 1 and 2	180	1	1	500	off = 0 strokes/min

Relay for power control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Relay adjustment	as per identity code				
Relay 1		Solenoid valve 1 Limit value 1* Actuator 1 Timer 1 Servomotor off			*For "limit value", the relays remain active, even in the event of a fault.
Relay 2		Solenoid valve 2 Limit value 2* Actuator 2 Timer 2 off			
Cycle min. time	10 s 1 s	1 s 1 s	10 s 1 s	9999 s Cycle/2	for solenoid valve for solenoid valve
Period (Cycle) t on	off 1 min	1 h 1 min	1 h / off 1 min	240 h 60 min	for timer for timer

IMPORTANT

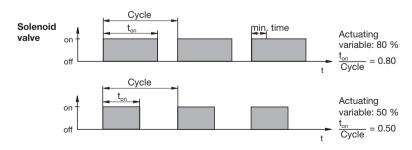

The timer will reset in the event of a power failure.

At the end of the (timer) cycle time the DULCOMETER® D1C closes the assigned relay for the duration of "t on" (timer). "Pause" interrupts the timer.

When the clock is shown in the LC display the timer can be reset to the start of the cycle at precisely this point using the enter button.

The % figure in the LC display indicates the progress of the current cycle.

Timer relays may be used, e.g. for shock metering or sensor cleaning.

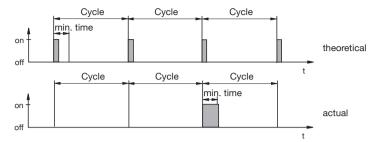

The switching time of the DULCOMETER® D1C (solenoid valve) depend on the actuating variable and the "min. time" (smallest permitted operating factor of the connected device).

The actuating variable determines the ratio t_{or}/cycle and thus the switching times (see fig. above).

The "min. time" influences the switching times in two situations:

a) theoretical switching time < min. time:

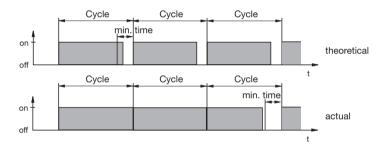

The DULCOMETER® D1C does not switch for a certain number of cycles until the sum of the theoretical switching times exceeds the "min. time". Then the DULCOMETER® D1C switches for the duration of this total time.

b) theoretical switching time > (cycle - min. time)

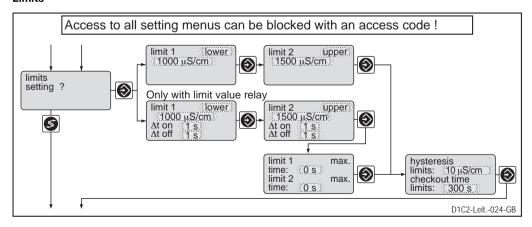

and

calculated switching time < cycle

The DULCOMETER® D1C does not deactivate for a certain number of cycles until the differences between cycle and theoretical switching time exceed the "min. time".

Limits

Switch-on delay ∆t on	0 s	1 s	0 s	9999 s	
Switch-off delay ∆t off	0 s	1 s	0 s	9999 s	

 $^{^{\}star}$ = only for connected terminal connection on standard signal, 2) = only with limit value relay

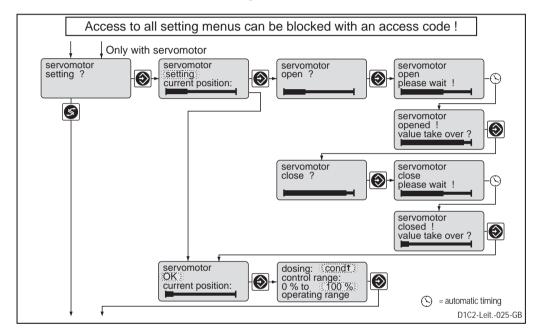

Servomotor

The **operating range** is defined by the total resistance range of the feedback potentiometer. The maximum limit of the range actually used is set by defining the **control range**.

ATTENTION

- Activation of the servomotor must be carried out with the same meticulous care as taken when calibrating a measuring probe.
- To ensure correct operation, the activation time of the actuator used should not be less than 25 seconds for the control range from 0...100 %!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Servomotor	setting	setting ok off			
Control direction	cond. ↑	cond. ∳ cond. ↓			
Control range	100 %	1 %	10 %	100 %	in % of operating range

NOTE

- If the broad bar is to the far right, the stroke adjustment motor is fully open.
- The continuous display shows the degree (in %) to which it is open (the greater the percentage, the more open the stroke adjustment motor).

Control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Control	normal	normal with dead zone manual			When controlling with dead zone, the feed forward control is not used for measured values within the dead zone
Setpoint	500 mS/cm 100 mS/cm 10 mS/cm 2500 μS/cm 1000 μS/cm 250 μS/cm 100 μS/cm 15 μS/cm 10 μS/cm	1 mS/cm 0.1 mS/cm 0.01 mS/cm 1 μS/cm 1 μS/cm 0.1 μS/cm 0.1 μS/cm 0.1 μS/cm 0.01 μS/cm	-50 mS/cm -10 mS/cm -1 mS/cm -250 μS/cm -100 μS/cm -25 μS/cm -25 μS/cm -10 μS/cm -2.5 μS/cm	1050 mS/cm 210 mS/cm 21 mS/cm 5250 μS/cm 2100 μS/cm 525 μS/cm 210 μS/cm 52.5 μS/cm 21 μS/cm	meas. range 1000 mS/cm* meas. range 200 mS/cm meas. range 20 mS/cm meas. range 5000 μS/cm* meas. range 2000 μS/cm* meas. range 500 μS/cm* meas. range 200 μS/cm* meas. range 20 μS/cm* meas. range 20 μS/cm* setpoint 2 ≥ setpoint 1
Control parameter xp	10 %	1 %	1 %	500 %	xp referred to measuring range
Control parameter Ti	off	1 s	1 s	9999 s	function off $= 0$ s
Control parameter Td	off	1 s	1 s	2500 s	function off $= 0$ s
Additional load	0 %	1 %	-100 %	+100 %	
Manual metering	0 %	1 %	-100 %	+100 %	

^{*}only with connection on terminal standard signal

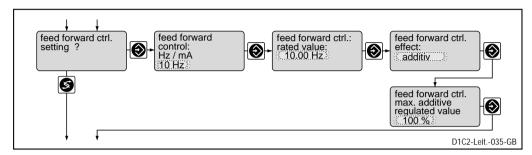

Abbreviations for control variables:

 $x_{p} = 1/Kp$ (inverse proportional co-efficient)

T_i = I controller integration time [s]

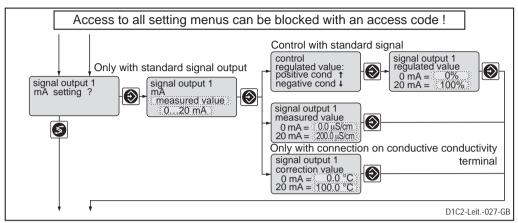

T_d = D controller differential time [s]

Feed forward control

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Feed forward control (Flow)	as per identity code with standard signal: 4-20 mA	None 10 Hz 500 Hz 020 mA 420 mA			signal processing: signal <0.02 Hz = no flow signal <0.2 Hz = no flow signal <0.2 mA = no flow signal <4.2 mA = no flow
Feed forward control rated value	10 Hz 500 Hz 20 mA	0.01 Hz 1 Hz 0.01 mA	0.1 Hz 5 Hz 0/4 mA	10 Hz 500 Hz 20 mA	Depended on signal type. Maximum limitation of range used.
Feed forward control effect	multiplicative	multiplicative additive			
Max. add. regulated value	100 %	1 %	-500 %	+500 %	only with add. feed forward control

Standard signal output 1

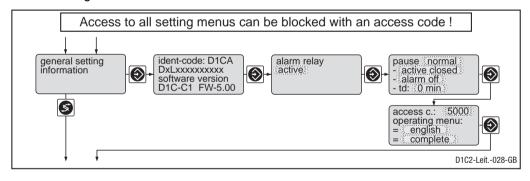

Standard signal output 2

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Variable allocation	as per identity code	measured value controlled variable correction value			If control applicable only with correction variable
Output range	020 mA	020 mA 420 mA			
Range measured value	0–20 μS/cm 0–50 μS/cm 0–200 μS/cm 0–500 μS/cm 0–2000 μS/cm 0–5000 μS/cm 0–5000 μS/cm 0–20 mS/cm 0–200 mS/cm	0.01 µS/cm 0.01 µS/cm 0.1 µS/cm 0.1 µS/cm 1 µS/cm 1 µS/cm 0.01 mS/cm 0.1 mS/cm	-1 μS/cm -2.5 μS/cm -10 μS/cm -25 μS/cm -100 μS/cm -250 μS/cm -1 mS/cm -10 mS/cm -50 mS/cm	21 μS/cm 52.5 μS/cm 210 μS/cm 525 μS/cm 2100 μS/cm 5250 μS/cm 21 mS/cm 210 mS/cm	meas. range 20 μS/cm meas. range 50 μS/cm* meas. range 200 μS/cm meas. range 500 μS/cm* meas. range 2000 μS/cm* meas. range 5000 μS/cm* meas. range 20 mS/cm meas. range 200 mS/cm meas. range 1000 mS/cm*
Range controlled variable	0 %+100 %	1 %	-100 %	+100 %	minimum range 1 %
Range correction value	0100 °C	0.1 °C	0.0 °C	100 °C	minimum range 1 °C

^{*}only with connection on standard signal

General setting

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Alarm relay	active	active not active			
Pause	normal	normal Hold			
Control input pause	active closed	active closed active open			reacts as make contact reacts as break contact
Alarm pause	off	off on			Alarm relay can be triggered by pause contact
td	0 min	1 min	0 min	60 min	
Access code	5000	1	1	9999	
Language	as per identity code				
Operating menu	complete	restricted complete			

Pause Normal

If the pause-switch is off, the DULCOMETER® D1C sets the operating outputs to "0" for as long as the pause-switch is off or for a set time-delay t_d (if t_d is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2): the I-proportion is stored when the pause is switched off (I-proportion then usually only present if Tn > 0 has been selected in the "Control setting?" setting menu).

Exception: the standard signal outputs mA for the measured value or correction value are not affected by the pause.

After pause is activated the operating outputs remain at "0" for the length of the time-delay t_a . The time-delay t_d must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay t_d is reconciled jointly with the current P-component and (if Tn is set > 0) with the stored I-component.

Pause Hold

If the pause-switch is off, the DULCOMETER® D1C freezes the operating output at the most recent value for as long as the pause-switch is off or for a set time-delay t_a (if t_a is set to > 0 min). Whilst the pause-switch is off, the D1C establishes the P-proportion in the background.

With PID-control (Identity code characteristics "control characteristic" = 2):

Even the mA standard signal outputs for measured value or correction value are frozen.

After pause is activated the operating outputs remain frozen for the length of the time delay t_d . The time delay t_d must be set up in such a way that, in this time e.g. sample water (process-specific current concentration) flows to the sensor.

With PID-control (Identity code characteristics "control characteristic" = 2): The control variable output resulting from the pause and the expiry of the time-delay t_d is reconciled jointly with the current P-proportionand (if Tn is set > 0) with the newly established I-proportion.

Operation	Note text	Symbol	Effect Alarm with On metering On control acknowledgemen	ct On control	Alarm with acknowledgement	Remarks	Remedy
