1 Device Identification / Identity Code

D1C A	DULCOMETER® Controller Series D1C / Version A
	Type of mounting
D	Control panel installation 96 x 96 mm
W	Wall mounting
	Operating voltage
0	230 V 50/60 Hz
1	115 V 50/60 Hz
2	200 V 50/60 Hz (only with control panel installation)
3	100 V 50/60 Hz (only with control panel installation)
4	24 V AC/DC
	Measured variable
T	Temperature (0-100 °C; 32-212 °F)
	Connection of measured variable
1	Terminal, standard signal 0/4-20 mA
5	Terminal mV
	Correction variable
0	None
	Feed forward control
0	None
1	As standard signal 0/4-20 mA
2	As frequency 0-500 Hz
3	As frequency 0-10 Hz
	Control input
0	None
1	Pause
	Signal output
0	None
1	Standard signal 0/4-20 mA measured value
2	Standard signal 0/4-20 mA control variable
3	Standard signal 0/4-20 mA correction variable
4	2 standard signal 0/4-20 mA outputs, free programmable
	Power control
G	Alarm and 2 limit value/timer relays
M	Alarm and 2 solenoid valve relays
R	Alarm relay and servomotor with feedback
	Pump control
0	None
2	Two pumps
	Control characteristic
0	None
1	Proportional control
2	PID control
	Log output
0	None
	Language
D	German
E	English
F	French
I	Italian
N	Dutch
S	Spanish
P	Polish
A	Swedish
U	Hungarian
G	Czech
T	Thai
K	Korean
C	Chinese

2 General User Information

General User Information

These operating instructions describe the technical data and function of the series DULCOMETER® D1C controller, provide detailed safety information and are divided into clear steps.

IMPORTANT

- ***Please observe the parts of these operating instructions applicable to your particular version! This is indicated in the Section "Device Identification / Identity Code".***
- ***Correct measuring and metering is only possible in the case of impeccable operation of the sensor. The sensor has to be calibrated / checked regularly!***

NOTE

A form "Documentation of controller settings type D1C" is available under www.prominent.com/documentation_D1C for the purpose of documenting the controller settings.

3 Device Overview / Controls

	CHANGE button To change over within a menu level and to change from one variable to another within a menu point.
STOP START	START/STOP button Start/stop of control and metering function.
	ENTER button To accept, confirm or save a displayed value or status. For alarm acknowledgement.

	UP button To increase a displayed numerical value and to change variables (flashing display)
	BRANCH BACK button Back to permanent display or to start of relevant setting menu.
	DOWN button To decrease a displayed numerical value and to change variables (flashing display).

4 Functional Description

NOTE

Please refer to the description of the complete operating menu in Section 8 for a detailed description of the individual characteristics of the DULCOMETER® D1C controller!

4.1 Operating Menu

The DULCOMETER® D1C controller permits settings to be made in two different menus – a “complete” and a “restricted” menu. All values are preset and can be changed in the complete operating menu. The controller is delivered with a restricted operating menu so that the D1C controller can be used effectively in many applications from the very onset. If adaptations prove to be necessary, all relevant parameters can then be accessed by switching over to the complete operating menu (see “General settings”).

4.2 Access Code

Access to the setting menu can be prevented by setting up an access code. The D1C controller is supplied with the access code 5000 which permits free access to the setting menu. The calibration menu remains freely accessible even if access to the setting menu is blocked by the code.

4.3 Control

The D1C can operate as a proportional controller or as a PID controller - depending on the device version (see identity code) and the setting.

The controlled variable is recalculated once a second. Control procedures which require rapid correction of setpoint deviations (less than approx. 30 seconds) cannot be processed with this controller. The cycle times must be taken into consideration when activating solenoid valves (pulse length) in the same way as their running times when activating servomotors (3-point).

Via the control input pause, the control function (selection of controlled variable) can be switched off. The calculation of the controlled variable starts again after cessation of "pause".

4.4 Feed Forward Control

The D1C controller can process a signal of a feed forward control. Depending on the device version (see identity code) and the setting, this signal can be obtained in any form of a 0–20 mA or 4–20 mA signal or as a digital contact signal with the maximum frequencies 10 Hz or 500 Hz.

This signal can be used, for example, for flow-proportional metering (multiplicative effect) or feed forward-dependent basic load metering (additive effect). The result of control variable calculation from the proportional or PID control is multiplied by or added to the feed forward signal. A multiplicative feed forward variable at the level of the set rated value carries over the calculated control variable unchanged into the controlled variable:

Controlled variable = Feed forward variable/rated value x calculated control variable

During start-up, the zero point has to be checked. The multiplicative feed forward control is not designed for switching off permanently the actuating variable (signal ≈ 0).

An additive feed forward variable at the level of the rated value results in maximum controlled variable:

Controlled variable (max. 100 %) = Feed forward variable/rated value x max. controlled variable + calculated control variable

4.5 Error Messages

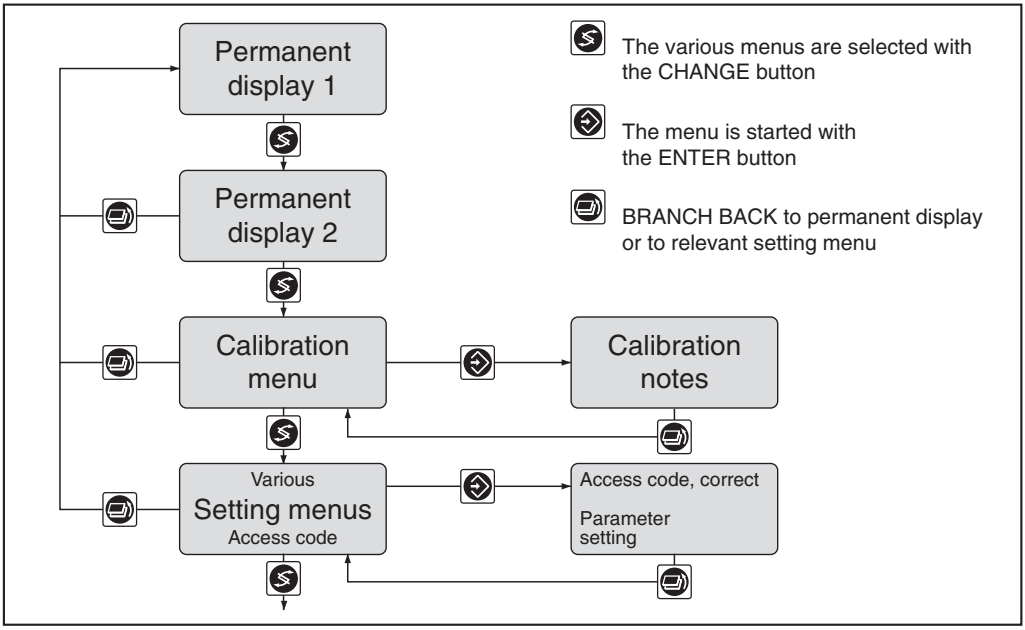
Error messages and information are indicated on the bottom line in the permanent display 1. Errors to be acknowledged (acknowledgement switches off the alarm relay) are indicated by the "Ɛ". Errors/notes which still apply after acknowledgement are indicated alternately. During correction variable processing (temperature for correction of fluoride-value), the value is indicated in the same line as the error/note. Faults which are rectified of their own accord due to changed operating situations are removed from the permanent display without the need for acknowledgement.

5 Display Symbols

The display of the DULCOMETER® D1C controller uses the following symbols:

Description	Comment	Symbol
Limit value transgression Relay 1, upper	Symbol left	
Relay 1, lower	Symbol left	
Relay 2, upper	Symbol right	
Relay 2, lower	Symbol right	
Metering pump 1 (heat) Control off	Symbol left	
Control on	Symbol left	
Metering pump 2 (cool) Control off	Symbol right	
Controll on	Symbol right	
Solenoid valve 1 (heat) Controll off	Symbol left	
Controll on	Symbol left	
Solenoid valve 2 (cool) Controll off	Symbol right	
Control on	Symbol right	
Servomotor Control, open relay		
Control, close relay		
Without control		
Position feedback	The bar increases from left to right during opening	
Stop button pressed		
Manual metering		
Fault		

6 Operation diagram



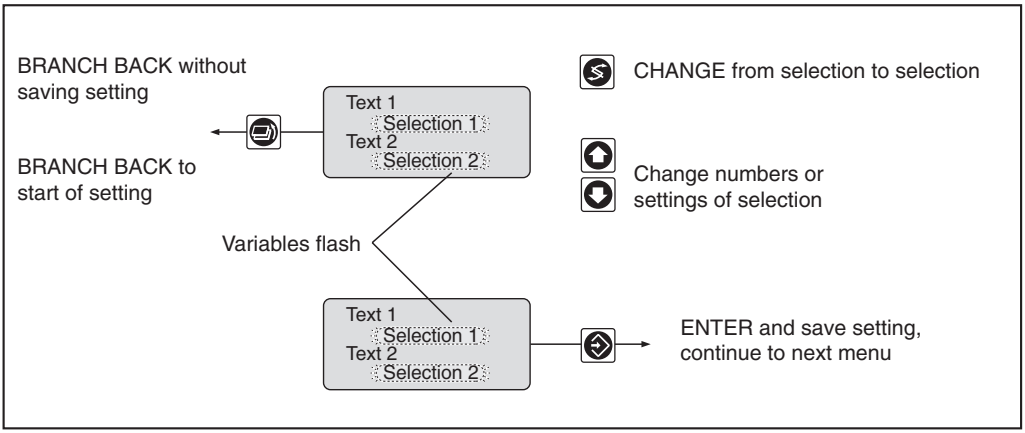
NOTE

Access to the setting menus can be barred with the access code!

The number and scope of setting menus depends on the device version!

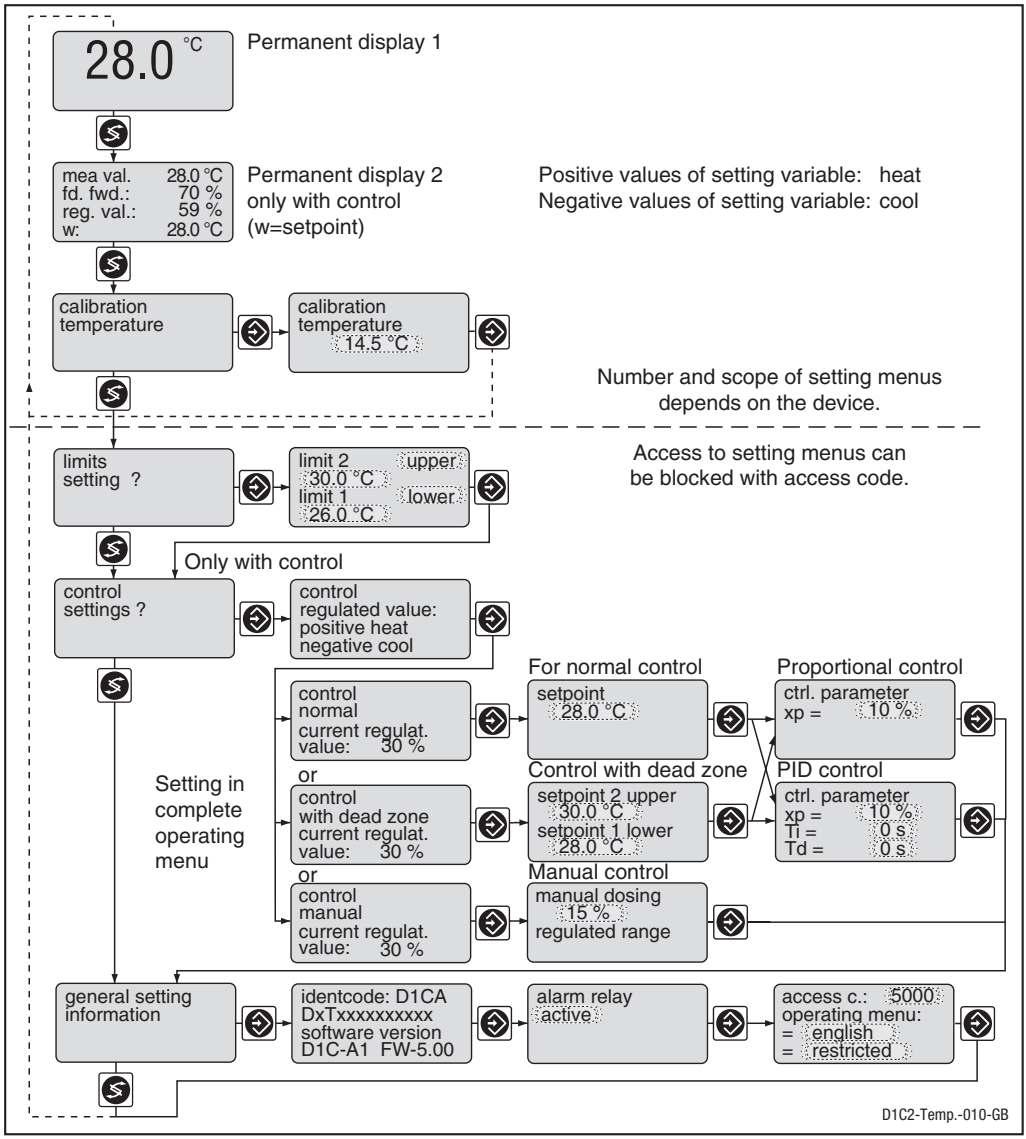
If the access code is selected correctly in a setting menu, the following setting menus are also accessible!

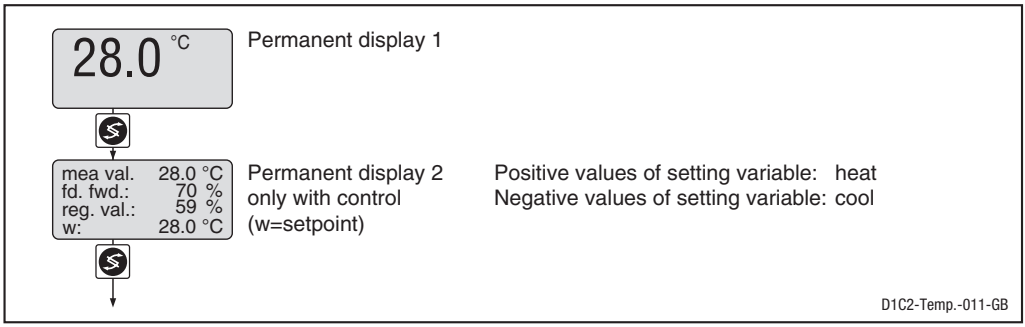
If within a period of 10 minutes no button is pushed, the unit automatically branches back from the calibrating menu or a setting menu to the permanent display 1.



7 Restricted Operating Menu / General Layout

The restricted operating menu permits simple operation of the most important parameters. The following overview shows the settings which can be selected:





Calibrating the Pt100

During calibration, the control function persists. The standard signal of the output (measured value) remains unchanged. The measured value registered during the start of the calibration is proposed as value; this value is adjustable.

IMPORTANT

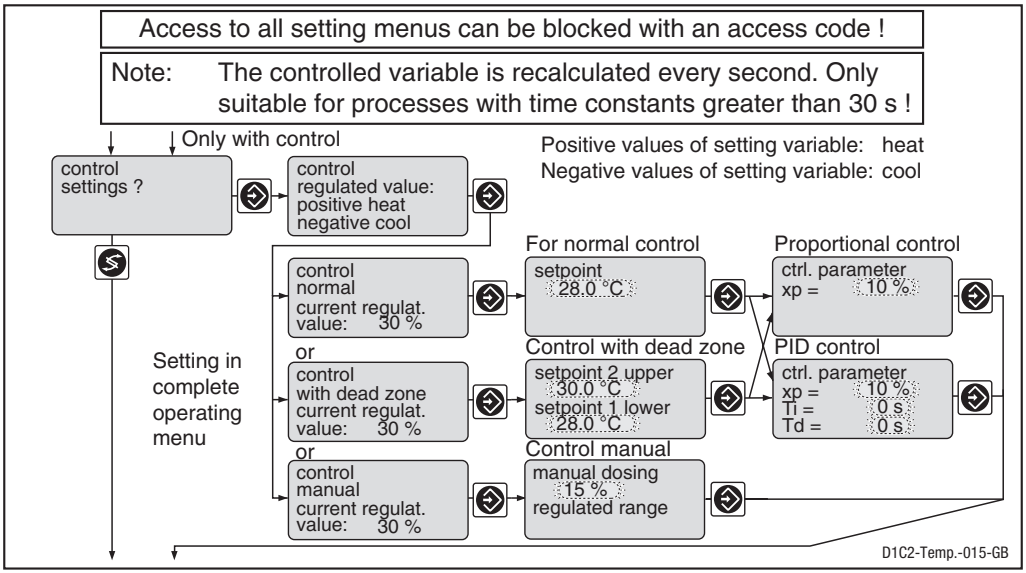
A change of the measuring unit (see page 14) must be done before calibration!

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
	Measured value	0.1 °C 0.1 °F	-5 °C 23 °F	105 °C 221 °F	

Limit values

		Initial value	Possible values Increment	Lower value	Upper value	Remarks
Type of limit trans-gression	Limit 1:	lower	upper lower			Limit transgression for exceeding or dropping below limit *only with limit value relay
	Limit 2:	upper	off*			
Limit value	Limit 1:	26.0 °C	0.1 °C	-5 °C	105 °C	Measuring unit °C
	Limit 2:	30.0 °C	0.1 °C	-5 °C	105 °C	
	Limit 1:	78.8 °F	0.1 °F	23 °F	221 °F	Measuring unit °F
	Limit 2:	86 °F	0.1 °F	23 °F	221 °F	

Control



Restricted Operating Menu / Description

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Setpoint	28.0 °C 82.4 °F	0.1 °C 0.1 °F	-5.0 °C 23 °F	105 °C 221 °F	Measuring unit: °Celsius Measuring unit: °Fahrenheit 2 setpoints necessary for control with dead zone. Setpoint 2 > setpoint 1
Control parameter xp	10 %	1 %	1 %	500 %	xp referred to measuring range
Control parameter Ti	off	1 s	1 s	9999 s	Function off = 0 s
Control parameter Td	off	1 s	1 s	2500 s	Function off = 0 s
Manual metering	0 %	1 %	-100 %	+100 %	

Abbreviation for control variables:

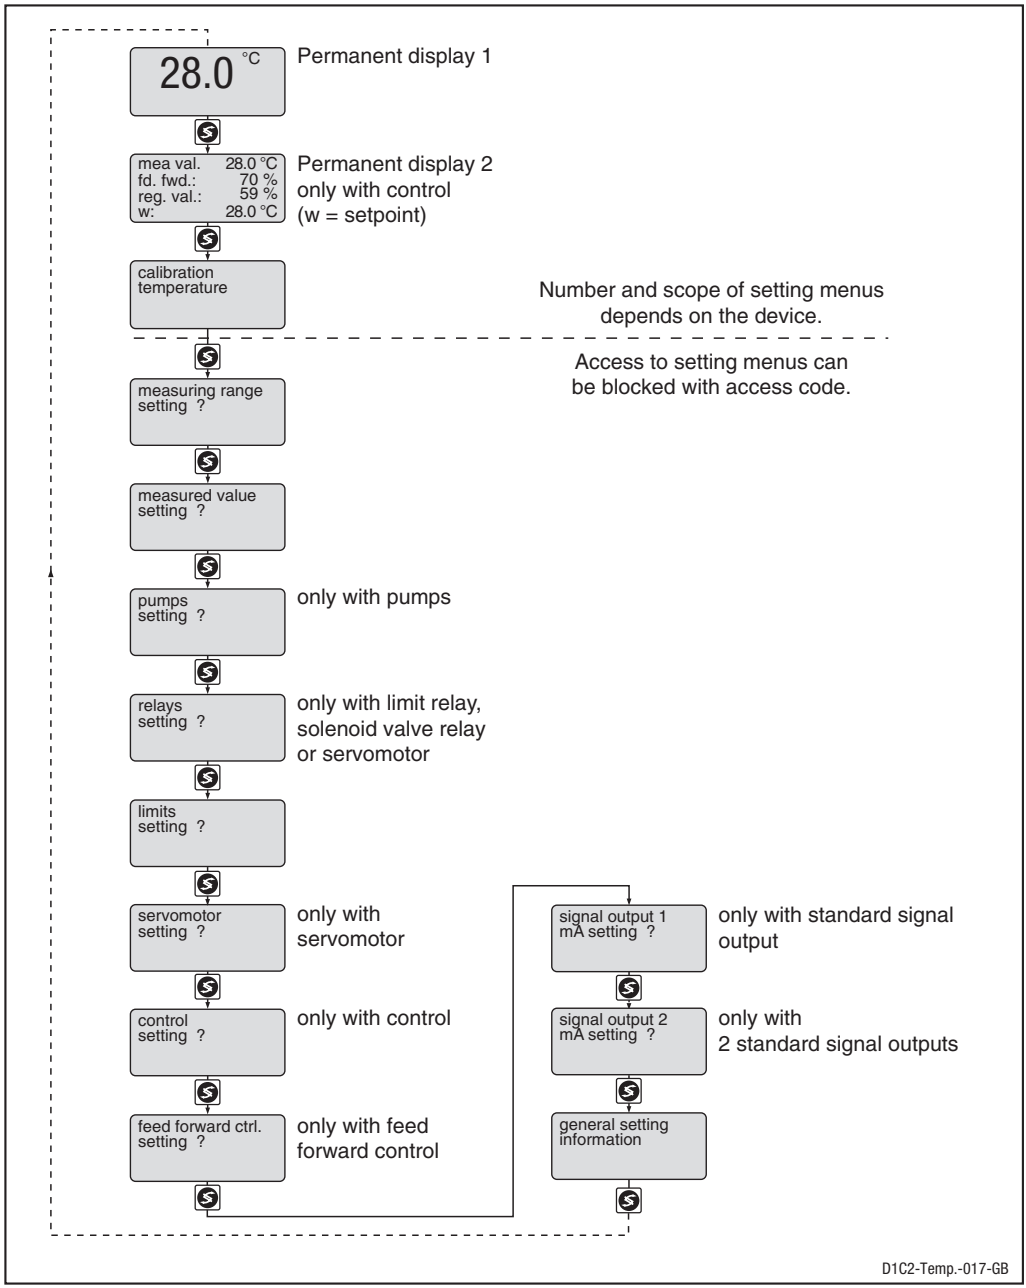
x_p = 100 %/Kp (inverse proportional coefficient)
T_i = I controller integration time [s]
T_d = D controller differential time [s]

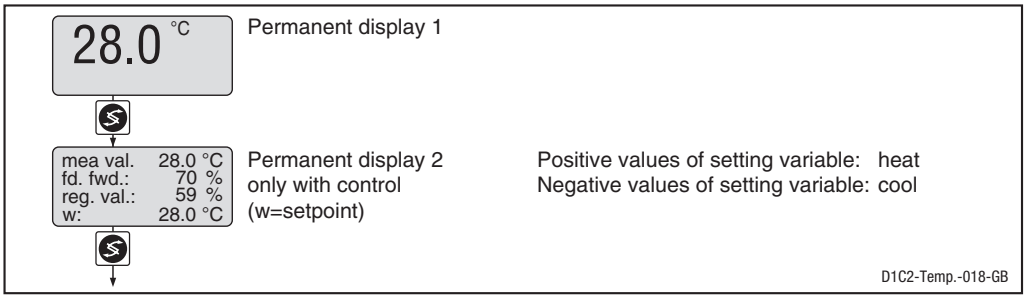
General settings

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Alarm relay	active	active not active			
Access code	5000	1	1	9999	
Language	as per identity code	as per identity code			
Operating menu	restricted	restricted complete			

8 Complete Operating Menu / Overview

All parameters of the controller can be set in the complete operating menu (access see previous page). The following overview shows the settings which can be selected:





Calibrating the Pt 100 (two-point calibration)

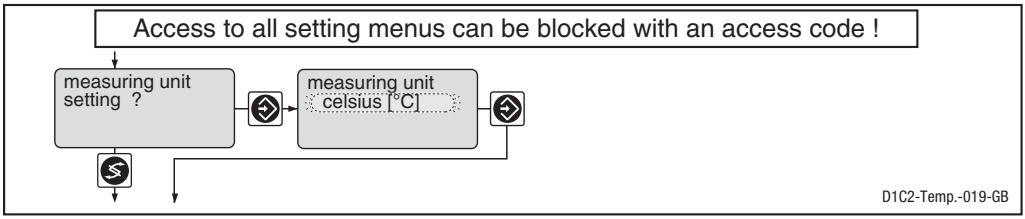
During calibration, metering is reduced to the set basic load. The standard signal of the output (measured value) is reduced to 0 mA or 4 mA. As value the measured value is proposed; this value is adjustable.

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
	Measured value	0.1 °C 0.1 °F	-5 °C 23 °F	105 °C 221 °F	

Error message	Condition	Effect
Temperatur distance too small	Δ temperature > 5.0 °C Δ temperature > 9.0 °F	Measured value deleted Repeat calibration of measuring point

Complete Operating Menu / Description

Measured variable

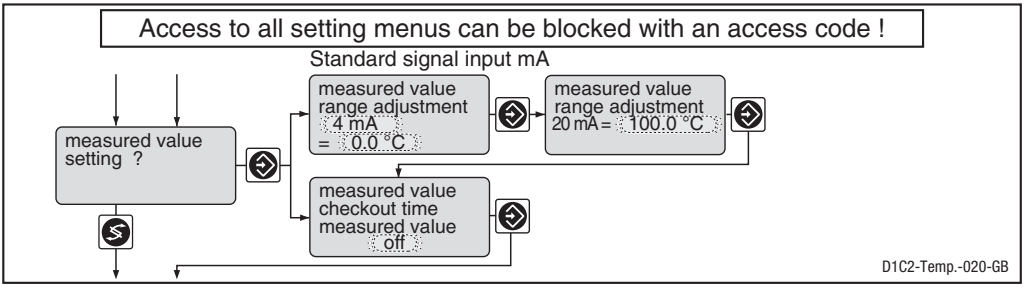


IMPORTANT

When changing the measuring unit adjustment, the adjustments in all menus have to be checked!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Measuring unit	Celsius (°C)	Celsius (°C) Fahrenheit (°F)			

Measured value



IMPORTANT

When changing the range adjustment, the temperature sensor must be newly calibrated and the adjustments in all menus have to be checked!

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Standard signal input lower signal limit	4 mA	0 mA 4 mA			
Allocated measuring range upper	0-100 °C 32-212 °F	0.1 °C 0.1 °F	-5 °C 23 °F	105 °C 221 °F	
Checkout time	off	1 s	1 s	9999 s	Constant measurement signal results in message and alarm. Function off = 0 s

Measured value checkout time

IMPORTANT

This function may not be activated for applications in which it can be assumed that the measured value will not change.

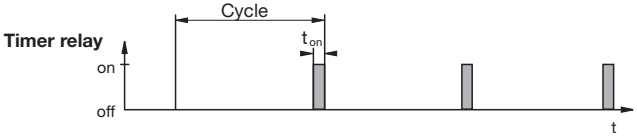
This function tests whether the measured value changes from that of the sensor (at the measured value input) within the “Measured value checkout time”. It is assumed that it will do so for an intact sensor.
If the measuring value does not change during this checkout time, the DULCOMETER® D1C sets the control variable to “0” and the alarm relay drops out. The LCD display shows e.g. the message “Te limit”.

Pumps

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Max. stroke/minute of pumps 1 and 2	180	1	1	500	off = 0 stroke/min

Relay for power control

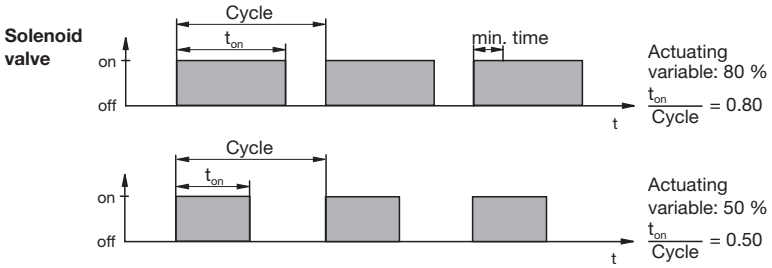
	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Relay adjustment	as per identity code				
Relay 1		Solenoid valve 1 Limit value 1* Actuator 1 Timer 1 Servomotor off			* In the case of “Limit value” - relays remain active even in the event of an error. only with servomotor
Relay 2		Solenoid valve 2 Limit value 2* Actuator 2 Timer 2 off			
Period	10 s	1 s	10 s	9999 s	for solenoid valve
min. time	1 s	1 s	1 s	period/2	for solenoid valve
Period	off	1 h	1 h/off	240 h	for timer
t on	1 min	1 min	1 min	60 min	for timer



IMPORTANT

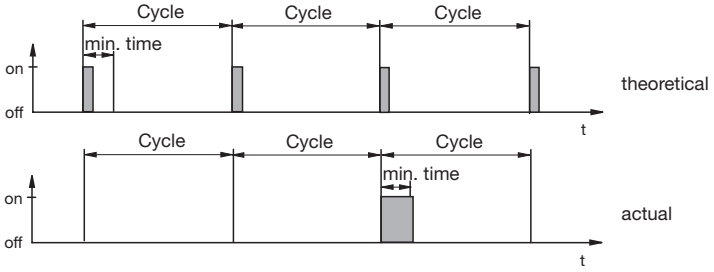
The timer will reset in the event of a power failure.

At the end of the (timer) cycle time the DULCOMETER® D1C closes the assigned relay for the duration of “t on” (timer). “Pause” interrupts the timer.
When the clock is shown in the LC display the timer can be reset to the start of the cycle at precisely this point using the enter button.
The % figure in the LC display indicates the progress of the current cycle.
Timer relays may be used, e.g. for shock metering or sensor cleaning.



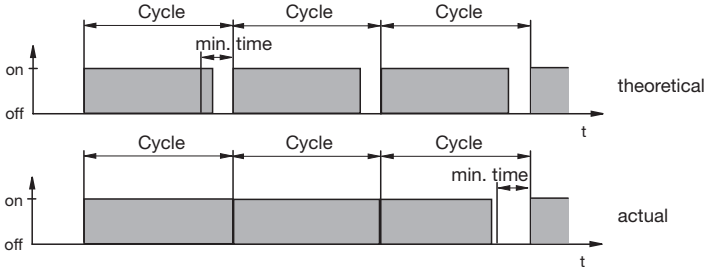
The switching time of the DULCOMETER® D1C (solenoid valve) depends on the actuating variable and the “min. time” (smallest permitted operating factor of the connected device).The actuating variable determines the ratio t_{on}/cycle and thus the switching times (see fig. above).
The “min. time” influences the switching times in two situations:

a) theoretical switching time < min. time:



The DULCOMETER® D1C does not switch for a certain number of cycles until the sum of the theoretical switching times exceeds the “min. time”. Then the DULCOMETER® D1C switches for the duration of this total time.

b) theoretical switching time > (cycle - min. time) and calculated switching time < cycle



The DULCOMETER® D1C does not deactivate for a certain number of cycles until the differences between cycle and theoretical switching time exceeds the “min. time”.

Limit values

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Type of limit transgression Limit 1:	lower	upper lower off*			Limit transgression when exceeding or dropping below value *only with limit value relay
Limit 2:	upper				
Limit value Limit 1:	28.0 °C	0.1 °C	-5 °C	105 °C	Measuring unit °Celsius
Limit 2:	30.0 °C	0.1 °C	-5 °C	105 °C	
Limit value Limit 1:	78.8 °F	0.1 °F	23 °F	221 °F	Measuring unit °Fahrenheit
Limit 2:	86 °F	0.1 °F	23 °F	221 °F	
Hysteresis limits	0.2 °C 0.4 °F	0.1 °C 0.1 °F	0 °C 0 °F	105 °C 221 °F	Effective in direction of cancelling limit transgression.
Checkout time limits Δt on	off	1 s	1 s	9999 s	Results in message and alarm. off = 1 s: Function switched off, no message, no alarm
Control	on	on off			
Switching direction Limit value 1 Limit value 2	active closed	active closed active open			Acts as N/O Acts as N/C
Switch-on delay Δt on	0 s	1 s	0 s	9999 s	
Switch-off delay Δt off	0 s	1 s	0 s	9999 s	

Servomotor

The **operating range** is defined by the total resistance range of the feedback potentiometer. The maximum limit of the range actually used is set by defining the **control range**.

IMPORTANT

- ***To ensure correct operation, the activation time of the servomotor used should not be less than 25 seconds for the control range from 0...100 %!***
- ***Activation of the servomotor must be carried out with the same meticulous care as taken when calibrating a measuring sensor.***

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Servomotor	setting	setting ok off			
Control direction	heat	heat cool			
Control range	100 %	1 %	10 %	100 %	in % of operating range

NOTE

- ***When the wide bar is as right as it will go, the stroke adjustment motor is fully open.***
- ***The permanent display shows to what degree the motor has opened in % (the greater the percentage, the farther open the servomotor.)***

Complete Operating Menu / Description

Control

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Control	normal	normal with dead zone manual			When controlling with dead zone, the feed forward control is not used for measured values within the dead zone.
Setpoint	28 °C 82,4 °F	0.1 °C 0.1 °F	-5 °C 23 °F	105 °C 221 °F	2 setpoints necessary for control with dead zone. Setpoint 1 > setpoint 2
Control parameter xp	10 %	1 %	1 %	500 %	xp referred to measuring range
Control parameter Ti	off	1 s	1 s	9999 s	Function off = 0 s
Control parameter Td	off	1 s	1 s	2500 s	Function off = 0 s
Additive basic load	0 %	1 %	-100 %	+100 %	
Manual metering	0 %	1 %	-100 %	+100 %	

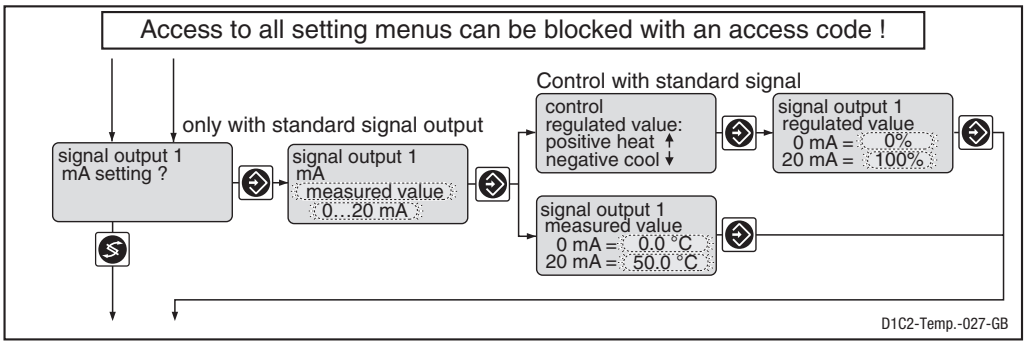
Abbreviation for control variables:

x_p = 100 %/Kp (inverse proportional coefficient)
T_i = I controller integration time [s]
T_d = D controller differential time [s]

Feed forward control

	Initial value	Possible values: Increment	Lower value	Upper value	Remarks
Feed forward control (Flow)	as per identity code at standard signal: 4–20 mA	None 10 Hz 500 Hz 0…20 mA 4…20 mA			Signal processing: Signal <0,02 Hz = No flow Signal <0,2 Hz = No flow Signal <0,2 mA = No flow Signal <4,2 mA = No flow
Feed forward control rated value	10 Hz 500 Hz 20 mA	0.01 Hz 1 Hz 0.1 mA	0.1 Hz 5 Hz 0/4 mA	10 Hz 500 Hz 20 mA	Depends on signal type. Maximum limitation of range used.
Feed forward control	multiplicative	multiplicative			
Disturbance effect		additive			
Max. additive regulated variable	100 %	1 %	-500 %	+500 %	Only with additive feed forward control.

Standard signal output 1



Standard signal output 2

	Initial value	Possible values Increment	Lower value	Upper value	Remarks
Variable allocation	as per identity code	Measured value Regulated variable			If control applicable
Output range	0…20 mA	0…20 mA 4…20 mA 3.6/4-20 mA			Reduction to 3.6 mA when alarm relay switches (not limit value violation)
Range measured value	0-50 °C 32-122 °F	0.1 °C 0.1 °F	-5°C 23 °F	105 °C 221 °F	Minimum range 0.1 % of measured value
Range controlled variable	0%…+100 %	1 %	-100 %	+100 %	Minimum range 1 %

General setting

		Possible values			
	Initial value	Increment	Lower value	Upper value	Remarks
Alarm relay	active	active not active			
Pause	normal	normal hold			
Control input pause	active closed	active closed active open			Acts as N/O Acts as N/C
Alarm Pause	alarm off	alarm off alarm on			Alarm relay can be activated through pause contact.
td	0 min	1 min	0 min	60 min	
Access code	5000	1	1	9999	
Language	as per identity code	as per identity code			
Operating menu	complete	restricted complete			

Normal pause

If the pause switch is off, the DULCOMETER® D1C sets the operating outputs to “0” for as long as the pause switch is off or for a set time delay t_d (if t_d is set to > 0 min). Whilst the pause switch is off, the D1C establishes the P-proportion in the background.
With PID-control (identity code characteristics “control characteristic” = 2): the I-proportion is stored when the pause is switched off (I-proportion then usually only present if Ti > 0 has been selected in the “Control setting?” setting menu).
Exception: the standard signal outputs mA for the measured value or correction value are not affected by the pause.
After pause is activated, the operating outputs remain at “0” for the length of the time delay t_d. The time delay t_d must be set up in such a way that in this time e.g. sample water (process-specific current concentration) flows to the sensor.
With PID-control (identity code characteristics “control characteristic” = 2): The control variable output resulting from the pause and the expiry of the time delay t_d is reconciled jointly with the current P-component and (if Ti is set > 0) with the stored I-component.

Pause hold

If the pause switch is off, the DULCOMETER® D1C freezes the operating output at the most recent value for as long as the pause switch is off or for a set time delay t_d (if t_d is set to > 0 min). Whilst the pause switch is off, the D1C establishes the P-proportion in the background.
With PID-control (identity code characteristics “control characteristic” = 2):
Even the mA standard signal outputs for measured value or correction value are frozen.
After pause is activated, the operating outputs remain frozen for the length of the time delay t_d. The time delay t_d must be set up in such a way that in this time e.g. sample water (process-specific current concentration) flows to the sensor.
With PID-control (identity code characteristics “control characteristic” = 2): The control variable output resulting from the pause and the expiry of the time delay t_d is reconciled jointly with the current P-proportion and (if Ti is set > 0) with the newly established I-proportion.

9 Faults / Notes / Troubleshooting

Fault	Fault text	Symbol	Effect On metering	Effect On Control	Alarm with ack-nowledgement	Remarks	Remedy
Measured variable Checkout time measured value exceeded	*Check Te-sensor*	E	Basic load	Stop	Yes	Function detachable	Check function of sensor
Signal exceeded/drops below value	*Temp. input* ↓↑	E	Basic load	Stop	Yes	Signal < 3.8 ±0.2mA or >23 ±0.2 mA	Check sensor, transducer and cable connection
Feed forward control mA - Signal drops below value multiplicative	*feedfwd input <4 mA*	E	stops	continue	Yes	Signal < 3.8 mA ±0.2 mA or >23 ±0.2 mA Value last valid is used	Check sensor, transducer and cable connection
additive		E	continue	continue			
- Signal exceeded	*feedfwd input >23 mA*	E	continue	continue	Yes		
Limit transgression after checkout time limit values	*Te -limit 1*	E				Function detachable	Define cause, reset values if necessary
Control "on"	*Te -limit 2*	E		Stop	Yes		
Control "off"		E	Stop or Basic load		Yes		
Servomotor Position not reached	*Servomot. defect*	E			Yes	Servomotor closes	Check servomotor
Electronics error	*System defect.*	EO	Stop	Stop	Yes	Electronic data defective	Call in service

Operation	Note text	Symbol	Effect on metering	Effect on control	Alarm with ack-nowledgement	Remarks	Remedy
Pause contact	*Pause*	EO	Stop	Stop	No/Yes*	No further fault check	–
	Pause/Hold	E		PI-compo-nent frozen			
Stop button	*Stop*	EO	Stop	Stop	No	Relay drops out	–
During servomotor setting Position feed back wrong	*Direction check*	E				Without correct adjustment the last valid values are still used	Check connection of relay and potentiometer. Adjust the operation range of the servomotor correctly.
Upper position <40 % max. value	*Final value too small*						
Lower position >30 % range	*Final value too big*						

*depending on whether "Alarm on" or "Alarm off" set in "General settings"
