INSTRUCTION MANUAL

DulcoFlex Peristaltic Pumps DFCa70

This manual forms an integral part of the pump and must accompany it until its demolition. The peristaltic pump is a machine destined to work in industrial areas and as such the instruction manual must form part of the legislative dispositions and the applicable technical standards and does not substitute any installation standard or eventual additional standard.

GENERAL SAFETY WARNING

Pumps are machines that due to their functioning under pressure and moving parts can present dangers.

- Improper use
- Removing the protections and/or disconnecting the protection device
- The lack of inspections and maintenance

CAN CAUSE SERIOUS DAMAGE OR INJURY

The person in charge of safety should therefore guarantee that

- The pump is transported, installed, put in service, used, maintained and repaired by qualified personnel who should therefore posses:

- Specific training and sufficient experience.
- Knowledge of the technical standards and applicable laws.
- Knowledge of the general national and local safety standards and also of installation.

Any work carried out on the electrical part of the pump should be authorised by the person responsible for safety. Given that the pump is destined to form part of an installation, it is the responsibility of whoever supervises the installation to guarantee absolute safety, adopting the necessary measures of additional protection.

HOSE MATERIAL: CONNECTIONS MATERIAL:

TRANSPORT, STORAGE and ELEVATION

TRANSPORT

- The pump is protected by a wood packaging.
- The packaging materials are recyclable.

STORAGE

• The pump should be in a resting position. (The hose should not be compressed). (Figure A)

- Avoid areas open to inclement weather or excessive humidity.
- For storage periods of longer than 60 days, protect the coupling surfaces (clamps, reducers, motors) with adequate anti-oxidant products.
- Spare tubes should be stored in a dry place away from direct light.

ELEVATION

• It's necessary to use elevation belts for the transport and the elevation of the pump. In the next figure it's shown the way to use the elevation belts:

GENERAL SAFETY STANDARDS

• The instructions of this manual, whose inobservance is determined as a failure to meet safety standards, are identified by this symbol

• The instructions of this manual, whose inobservance compromises electrical safety, are identified by this symbol.

• The instructions of this manual, whose inobservance compromises the correct working of the pump, are identified with this symbol.

Do not start the pump without first having installed the front cover.

For any manipulation of the equipment, it is necessary to make certain that the pump is stopped and the electricity supply is "locked out/tagged out".

Changing the hose should be done with the pump stopped.

WARNING!

Do not exceed the nominal pressure, speed or temperature of the pump, or use the pump for applications other than that originally planned without first consulting the manufacturer or distributor.

WARNING!

recommended.

Do not start the pump without it being properly secured to the floor.

Do not carry out any maintenance operations or dismantle the pump without first making sure that the pipes are not under pressure and are empty or isolated.

Cleaning the pipe, including the hose, should be done with fluids compatible

with the mentioned drive pump and at its maximum temperature

The start system of the motor should be provided with a direction inverter, stop-go button and emergency stop button (together with the pump), in such a way that the pump can be manipulated with total safety.

As the peristaltic pump is volumetric and its functioning is positive displacement, an overload of pressure ("dead head" condition) is possible. For this reason it is advisable to install a pressure relief valve.

Check the turning direction of the pump, as it is reversible it could generate pressure in the suction and compromise the safety of the installation. The circulation of the fluid should be in the same direction as the turning direction of the pump as seen from the inspection plate situated on the front cover.

The durability of the hose can not be defined precisely so it is necessary to foresee the possibility of a hose failure and subsequent leakage of fluid. A moisture sensor probe is recommended to detect the leakage and turn off the pump preventing further material leakage.

As the hose having an indeterminate life, and due to the possibility of its breakage or deterioration, the user is responsible for the prevention of a possible (although most unlikely) incorporation of breaks from the hose into the product being pumped, once the breakage phase or its deterioration has begun, either by means of filtration or a detection and removal of the possible breaks.

For C.I.P., or S.I.P. process, or similar, it's necessary to contact with the manufacturer, because it's necessary to use a determinate installation, and cleaning conditions.

GENERAL DESCRIPTION

PERISTALTIC PUMP

• Construction of the pump.

As shown in the figure below, the pump unit is a very simple design, robust and with very few moving parts.

The outer casing (1) terminates with flanged connections. Inside the casing are found the rotor (2), completed with two rollers (3). As this is revolving it compresses the reinforced tube (4) and in this way generates a pumping action. A change in the direction of rotation will give rise to a change in direction of the pumped fluid.

INSTALLATION

- Installation should normally be made in a well ventilated area away from heat sources. If it is necessary to place the pump outside it should be provided with a cover to protect it from sunlight and inclement weather.
- The positioning of the pump should allow easy access for all kinds of maintenance operations.
- Suction. The pump should be as near as possible to the supply of liquid so that the suction pipe is as short and straight as possible. The suction pipe should be perfectly airtight and made of suitable material so that it does not collapse due to the internal drop in vacuum. The minimum diameter should be similar to that of the tubular element. With viscous fluids a larger diameter is recommendable. (Consult manufacturer or distributor). The pump has a positive suction and does not require an inlet valve. The pump is reversible, and so the suction connection can be either flange. (Normally the one which adapts itself physically better to the installation would be chosen). It is recommendable to use a flexible connection between the piping and the collars of the pump in order to avoid the transmission of vibration to the piping.
- **Discharge.** To reduce power being absorbed, use the straightest and shortest piping possible. The diameter should be the same as the nominal diameter of the pump, excepting precise calculations of load losses. With viscous fluids a bigger diameter is needed. (Consult the manufacturer or distributor). Connecting the fixed piping to the pump with a length of flexible pipe facilitates maintenance and avoids vibrations and loads on the pump. Connect the piping firmly. The discharge is slightly pulsatory: To avoid such effect, it is advisable to install adequate pulsation dampeners. (See accessories.)

ROLLER PRESSURE ADJUSTMENT

The peristaltic pump, includes a shims (Figure 6), that are used to adjust the exact pressing distance of the roller (figure 9).

The shims are installed from factory to work at the work conditions indicated (in function of the speed and the work pressure), and following the next tables: DFC70 (number of shims of 1 mm.)

		• /	-		
rpm	n 0-19	20-39	40-59	60-79	80-99
PSI					
7.25	1	1	0	0	0
29	1	1	1	0	0
58	2	2	2	1	1
87	3	3	2		
116	4	3	3		

WORK CONDITIONS

There are limits of temperatures and pressures, in function of the hose selected. Those limits are:

MATERIAL	TEMPERATURE	TEMPERATURE	AMBIENT TEMPERATURE	PRESSURE
	MIN. (°C)	MAX. (°F)	MIN. (°F)	MAX. (PSI)
NR	-4	176	-40	116
NBR	14	176	-40	116
EPDM	14	176	-40	116
NR-A	14	176	-40	116
NBR-A	14	176	-40	116

PERFORMANCE CURVE

1.76 gal/rev

CHECKS BEFORE SWITCHING ON THE PUMP

Check that the pumping equipment has not suffered any damage during transportation or storage, any damage should be notified to the supplier immediately.

Check that the available voltage is suitable for the motor.

Make sure that the hose is suitable for the fluid to be pumped and that it will not be chemically affected; check also that the temperature of the fluid does not exceed the maximum temperature rating of the pump.

If the hose is in a resting position, then the pump has come from storage or transportation; now is the moment to install the second roller. Do not switch on the pump without the pump body cover being correctly installed.

Lubrication. Check that the drive pump, the hose and rollers are correctly greased. The specially formulated grease can be obtained from the authorised distributor.

Check that the protectors of the moving parts are correctly assembled.

Check that the thermal protector corresponds with that of the values on the plate on the motor.

Check that the direction of rotation is the desired one. (rotation test).

Check that the optional electrical components are connected to the control panel and test that they function correctly.

In cases of doubt of the valuation of discharge pressure (e.g. high viscosity), mount a pressure gauge on the discharge piping.

Check in predicted working conditions that the values of flow, pressure and absorbed power of the motor correspond to the project.

MAINTENANCE

Any work carried out on the pump must be done when the pump is stationary and disconnected from the electricity supply.

Lubrication

Check that the rollers and the hose are correctly greased. Check it every 200 hours of work. Add lubricant as necessary.

Check that the lubricant level in the gear reducer is correct and carry out periodic changes of lubricant according to the maintenance manual.

REPOSITIONING OF HOSE - DISMANTLING

- First, all valves must be closed to prevent losses of the product.
- Disconnect the suction and discharge pipes.
- Dismantling of the suction/discharge connections. Dismantling one roller. With the front cover mounted, start the pump 180° until the other roller is no longer compressing the hose. Disassemble the other roller, and the hose.

REPOSITIONING OF HOSE - MOUNTING

- Clean the internal surfaces of the pump body. Lubricate the internal faces of the pump body where there could be friction with the hose. To carry out this operation correctly it is necessary to remove the front cover.
- Insert the connections in each hose end.
- Install the hose in the pump body, lubricating with grease the hose and the rollers.
- Mount the tightening collars that fasten the hose and its connections to the pump body.
- Fit the front cover (2 screws only).
- Rotate the pump until the rotor in the correct position (compressed) to fit the second roller.
- Remove the front cover.
- Fit the second roller.
- Install the front cover.
- Connect suction/discharge pipes.

PROBLEMS, CAUSES AND SOLUTIONS

PROBLEM	POSSIBLE CAUSES AND SO	SOLUTIÓN
Elevated	Hose with no lubricant	Use original lubricant
Temperature	Elevated temperature of product	Reduce pumping temperature
	Poor or bad suction conditions	Check there are no obstructions
		Recalculate sections and lengths
	Excessive pipe tightening	Check roller pressure adjustment
	Excessive pumping speed	Reduce velocity of pump
Reduction of	Suction or impulsion valve closed.	Open valves
Capacity/pressure	Hose insufficiently compressed	Check roller pressure adjustment
	Rupture of the hose (the product leaks to the	
	casing)	Replace drive hose
	Partial obstruction of suction piping	Clean piping
	Insufficient product amount in suction reservoir	Fill or stop
	Insufficient diameter of suction piping	Increase section length/reduce pump speed
	Excessive length of suction pipe	Shorten suction piping
	High viscosity of product	Reduce viscosity
		Increase section length of piping
		Confirm that the pump is suitable
	Entry of air via the suction connections	
	High pulsation on suction	Tighten connections and accessories
		Mount antipulsation equipment
		Reconsider application (speed etc.)
Vibrations in	The piping is not correctly fixed together	Examine piping for loose connections
pump and piping	Excessive pumping speed	Reduce the speed of the pump
1 A P A P F 3		
	Insufficient diameter of piping	Increase pipe diameter
	Bedplate of pump loose	Fix the bedplate firmly
	Elevated pulsation of pump	Install pulsation dampener on suction side
Short life of the	Chemical attack	Confirm compatibility of the hose with the
hose		pumped fluid and the cleaning fluid
	High speed of pump	Reduce speed of pump
	High pumping temperature	Reduce temperature of product
	High working pressure	Reduce speed of pump
		Increase section diameter of piping
	Abnormal elevation of temperature	Check roller pressure adjustment
	Unsuitable lubricant	Use original lubricant
	Insufficient quantity of grease	Top up lubricant
	Cavitation of the pump	Re-evaluate suction conditions
Stretching of the	Insufficient grease	Top up lubricant
	High suction pressures (>3 Bar)	Reduce suction pressure
pump	Hose full of sediment	Clean hose
	Brackets insufficiently tightened	Retighten brackets
	Insufficient starter power	Increase starter power
start	Insufficient power from frequency convertor	Increase power
		Check that the voltage is adequate
		Do not drop below a frequency of 10Hz
		(confirm this point with the distributor)
		The starting up will occur at least 10Hz.
	Blockage in the pump	Check there are no obstructions in the pipe

DECLARATION OF CONFORMITY

The company:

Declares under its own sole responsibility that the next industrial peristaltic pump:

Model: DFC-70

Serial number:

<u>CE DECLARATION OF CONFORMITY</u> (Ann. II.A, 98/37/CE)

The pump is conform to the safety requirements according to the 98/37/CE norms and amendments.

□ <u>MANUFACTURER DECLARATION</u> (Ann. II.B, 98/37/CE)

The pump cannot be operated before the machine in which is assembled the pump, will be declared in conformity with the safety requirements according to the 98/37/CE norms and amendments.

FOOD PRODUCTS-CONTACT SUITABILITY DECLARATION

The pump is made with materials suitable to come in contact with food grade product according to the 89/109/EEC norms and amendments.

on:

The technical Director.

GUARANTEE

- The contractor shall obtain from the manufacturer its warranty that the equipment shall be warranted for a period of one (1) year from the date of start-up or 18 months from signed delivery acknowledgement, whichever comes first, to be free from defects in materials and workmanship. This guarantee does not include the hose or the lubricant as these are elements that have a normal function wear, irrespective of their duration.
- This guarantee is valid as long as the equipment functions within the parameters indicated in the technical information card supplied with every pump or on subsequent changes authorised.
- This guarantee includes materials and work but not the transportation of materials to or from our warehouses, being necessary to do so arising from the necessities of the client, the corresponding costs of displacement and expenses will be charged.
